

# Package ‘bayesplot’

May 3, 2019

**Type** Package

**Title** Plotting for Bayesian Models

**Version** 1.6.0

**Date** 2018-08-01

**Maintainer** Jonah Gabry <jsg2201@columbia.edu>

**Description** Plotting functions for posterior analysis, model checking, and MCMC diagnostics. The package is designed not only to provide convenient functionality for users, but also a common set of functions that can be easily used by developers working on a variety of R packages for Bayesian modeling, particularly (but not exclusively) packages interfacing with 'Stan'.

**License** GPL (>= 3)

**LazyData** TRUE

**URL** <http://mc-stan.org/bayesplot>

**BugReports** <https://github.com/stan-dev/bayesplot/issues/>

**SystemRequirements** pandoc (>= 1.12.3), pandoc-citeproc

**Depends** R (>= 3.1.0)

**Imports** dplyr (>= 0.7.1), ggplot2 (>= 2.2.1), reshape2, stats, utils, rlang, ggridges

**Suggests** arm, gridExtra (>= 2.2.1), knitr (>= 1.16), loo (>= 2.0.0), rmarkdown (>= 1.0.0), rstan (>= 2.17.1), rstanarm (>= 2.17.4), rstantools (>= 1.5.0), scales, shinystan (>= 2.3.0), testthat (>= 2.0.0), vdiff

**RoxygenNote** 6.0.1

**VignetteBuilder** knitr

**Encoding** UTF-8

**NeedsCompilation** no

**Author** Jonah Gabry [aut, cre],  
Tristan Mahr [aut],  
Paul-Christian Bürkner [ctb],  
Martin Modrák [ctb],  
Malcolm Barrett [ctb]

**Repository** CRAN

**Date/Publication** 2018-08-02 13:00:03 UTC

bayesplot-package	<i>Plots for Bayesian Models</i>
-------------------	----------------------------------

---

## Description

The **bayesplot** package provides a variety of **ggplot2**-based plotting functions for use after fitting Bayesian models (typically, though not exclusively, via Markov chain Monte Carlo). The package is designed not only to provide convenient functionality for users, but also a common set of functions that can be easily used by developers working on a variety of packages for Bayesian modeling, particularly (but not necessarily) packages powered by **rstan**. Examples of packages that will soon (or already are) using **bayesplot** are **rstan** itself, as well as the **rstan**-dependent **rstanarm** and **brms** packages for applied regression modeling.

## Plotting functionality

The plotting functions in **bayesplot** are organized into several modules:

- **MCMC**: Visualizations of Markov chain Monte Carlo (MCMC) simulations generated by *any* MCMC algorithm as well as diagnostics. There are also additional functions specifically for use with models fit using the [No-U-Turn Sampler \(NUTS\)](#).
- **PPC**: Graphical posterior predictive checks (PPCs).

In future releases modules will be added specifically for forecasting/out-of-sample prediction and other inference-related tasks.

## Resources

- **Bug reports and feature requests**: If you would like to request a new feature or if you have noticed a bug that needs to be fixed please let us know at the **bayesplot** issue tracker on GitHub:  
<https://github.com/stan-dev/bayesplot/issues/>.
- **General questions and help**: To ask a question about **bayesplot** on the Stan Forums forum please visit:  
<http://discourse.mc-stan.org>.

## See Also

[theme\\_default](#) for the default ggplot theme used by **bayesplot**.  
[bayesplot-colors](#) to set or view the color scheme used for plotting.  
[ggsave](#) in **ggplot2** for saving plots.

## Examples

```
# A few quick examples (all of the functions have many examples
# on their individual help pages)

# MCMC plots
x <- example_mcmc_draws(params = 5)
mcmc_intervals(x, prob = 0.5)
mcmc_intervals(x, regex_pars = "beta")

color_scheme_set("purple")
mcmc_areas(x, regex_pars = "beta", prob = 0.8)

color_scheme_set("mix-blue-red")
mcmc_trace(x, pars = c("alpha", "sigma"),
           facet_args = list(nrow = 2))
```

```

color_scheme_set("brightblue")
mcmc_scatter(x, pars = c("beta[1]", "sigma"),
             transformations = list(sigma = "log"))

# Graphical PPCs
y <- example_y_data()
yrep <- example_yrep_draws()
ppc_dens_overlay(y, yrep[1:50, ])

color_scheme_set("pink")
ppc_stat(y, yrep, stat = "median") + grid_lines()
ppc_hist(y, yrep[1:8, ])

```

---

available\_ppc

*Get or view the names of available plotting functions*

---

## Description

Get or view the names of available plotting functions

## Usage

```
available_ppc(pattern, fixed = FALSE, invert = FALSE)
```

```
available_mcmc(pattern, fixed = FALSE, invert = FALSE)
```

## Arguments

pattern, fixed, invert  
 Passed to [grep](#).

## Value

A possibly empty character vector of function names with several additional attributes (for use by a custom print method). If pattern is missing then the returned object contains the names of all available plotting functions in the [MCMC](#) or [PPC](#) module, depending on which function is called. If pattern is specified then a subset of function names is returned.

## Examples

```

available_mcmc()
available_mcmc("nuts")
available_mcmc("rhat|neff")
available_ppc("grouped")
available_ppc("grouped", invert = TRUE)

```

---

bayesplot-colors	<i>Set, get, or view color schemes</i>
------------------	--

---

## Description

Set, get, or view color schemes. Choose from a preset scheme or create a custom scheme.

## Usage

```
color_scheme_set(scheme = "blue")

color_scheme_get(scheme, i)

color_scheme_view(scheme)
```

## Arguments

scheme	<p>For <code>color_scheme_set</code>, either a string naming one of the available color schemes or a character vector of <i>exactly six</i> colors specifying a custom scheme (see the <b>Custom Color Schemes</b> section, below, for more on specifying a custom scheme).</p> <p>For <code>color_scheme_get</code>, <code>scheme</code> can be missing (to get the current color scheme) or a string naming one of the preset schemes.</p> <p>For <code>color_scheme_view</code>, <code>scheme</code> can be missing (to use the current color scheme) or a character vector containing a subset of the available scheme names.</p> <p>Currently, the available preset color schemes are:</p> <ul style="list-style-type: none"> <li>• "blue", "brightblue"</li> <li>• "gray", "darkgray"</li> <li>• "green"</li> <li>• "pink"</li> <li>• "purple"</li> <li>• "red"</li> <li>• "teal"</li> <li>• "yellow"</li> <li>• <b>"viridis"</b>, "viridisA", "viridisB", "viridisC"</li> <li>• "mix-x-y", replacing x and y with any two of the scheme names listed above (e.g. "mix-teal-pink", "mix-blue-red", etc.). The order of x and y matters, i.e., the color schemes "mix-blue-red" and "mix-red-blue" are not identical. There is no guarantee that every possible mixed scheme will look good with every possible plot.</li> </ul> <p>If you have a suggestion for a new color scheme please let us know via the <b>bayesplot</b> <a href="#">issue tracker</a>.</p>
i	<p>For <code>color_scheme_get</code>, a subset of the integers from 1 (lightest) to 6 (darkest) indicating which of the colors in the scheme to return. If <code>i</code> is not specified then all six colors in the scheme are included.</p>

**Value**

`color_scheme_set` has the side effect of setting the color scheme used for plotting. It also returns (*invisibly*) a list of the hexadecimal color values used in scheme.

`color_scheme_get` returns a list of the hexadecimal color values (without changing the current scheme). If the `scheme` argument is not specified the returned values correspond to the current color scheme. If the optional argument `i` is specified then the returned list only contains `length(i)` elements.

`color_scheme_view` returns a ggplot object if only a single scheme is specified and a gtable object if multiple schemes names are specified.

**Custom Color Schemes**

A **bayesplot** color scheme consists of six colors. To specify a custom color scheme simply pass a character vector containing either the names of six *colors* or six hexadecimal color values (or a mix of names and hex values). The colors should be in order from lightest to darkest. See the end of the **Examples** section for a demonstration.

**See Also**

`theme_default` for the default ggplot theme used by **bayesplot**.

**Examples**

```
color_scheme_set("blue")
color_scheme_view()

color_scheme_get()
color_scheme_get(i = c(3, 5)) # 3rd and 5th colors only

color_scheme_get("brightblue")
color_scheme_view("brightblue")

# compare multiple schemes
color_scheme_view(c("pink", "gray", "teal"))
color_scheme_view(c("viridis", "viridisA", "viridisB", "viridisC"))

color_scheme_set("pink")
x <- example_mcmc_draws()
mcmc_intervals(x)

color_scheme_set("teal")
color_scheme_view()
mcmc_intervals(x)

color_scheme_set("red")
mcmc_areas(x, regex_pars = "beta")

color_scheme_set("purple")
color_scheme_view()
y <- example_y_data()
```

```

yrep <- example_yrep_draws()
ppc_stat(y, yrep, stat = "mean") + legend_none()

color_scheme_set("mix-teal-pink")
ppc_stat(y, yrep, stat = "sd") + legend_none()
mcmc_areas(x, regex_pars = "beta")

#####
### custom color scheme ###
#####
orange_scheme <- c("#ffebcc", "#ffcc80",
                  "#ffad33", "#e68a00",
                  "#995c00", "#663d00")
color_scheme_set(orange_scheme)
mcmc_areas(x, regex_pars = "alpha")
mcmc_dens_overlay(x)
ppc_stat(y, yrep, stat = "var") + legend_none()

```

---

bayesplot-extractors    *Extract quantities needed for plotting from model objects*

---

## Description

Generics and methods for extracting quantities needed for plotting from various types of model objects. Currently methods are only provided for stanfit (**rstan**) and stanreg (**rstanarm**) objects, but adding new methods should be relatively straightforward.

## Usage

```

log_posterior(object, ...)

nuts_params(object, ...)

rhat(object, ...)

neff_ratio(object, ...)

## S3 method for class 'stanfit'
log_posterior(object, inc_warmup = FALSE, ...)

## S3 method for class 'stanreg'
log_posterior(object, inc_warmup = FALSE, ...)

## S3 method for class 'stanfit'
nuts_params(object, pars = NULL, inc_warmup = FALSE, ...)

## S3 method for class 'stanreg'

```

```

nuts_params(object, pars = NULL, inc_warmup = FALSE, ...)

## S3 method for class 'list'
nuts_params(object, pars = NULL, ...)

## S3 method for class 'stanfit'
rhat(object, pars = NULL, ...)

## S3 method for class 'stanreg'
rhat(object, pars = NULL, regex_pars = NULL, ...)

## S3 method for class 'stanfit'
neff_ratio(object, pars = NULL, ...)

## S3 method for class 'stanreg'
neff_ratio(object, pars = NULL, regex_pars = NULL, ...)

```

### Arguments

<code>object</code>	The object to use.
<code>...</code>	Arguments passed to individual methods.
<code>inc_warmup</code>	A logical scalar (defaulting to FALSE) indicating whether to include warmup draws, if applicable.
<code>pars</code>	An optional character vector of parameter names. For <code>nuts_params</code> these will be NUTS sampler parameter names rather than model parameters. If <code>pars</code> is omitted all parameters are included.
<code>regex_pars</code>	An optional <a href="#">regular expression</a> to use for parameter selection. Can be specified instead of <code>pars</code> or in addition to <code>pars</code> .

### Value

`log_posterior` `log_posterior` methods return a molten data frame (see [melt](#)). The data frame should have columns "Iteration" (integer), "Chain" (integer), and "Value" (numeric). See **Examples**, below.

`nuts_params` `nuts_params` methods return a molten data frame (see [melt](#)). The data frame should have columns "Parameter" (factor), "Iteration" (integer), "Chain" (integer), and "Value" (numeric). See **Examples**, below.

`rhat`, `neff_ratio` Methods return (named) vectors.

### See Also

[MCMC-nuts](#), [MCMC-diagnostics](#)

### Examples

```

## Not run:
library(rstanarm)
fit <- stan_glm(mpg ~ wt, data = mtcars)

```

```
np <- nuts_params(fit)
head(np)
tail(np)

lp <- log_posterior(fit)
head(lp)
tail(lp)

## End(Not run)
```

---

bayesplot-helpers	<i>Convenience functions for adding or changing plot details</i>
-------------------	--

---

## Description

Convenience functions for adding to (and changing details of) ggplot objects (many of the objects returned by **bayesplot** functions). See the **Examples** section, below.

## Usage

```
vline_at(v, fun, ..., na.rm = TRUE)

hline_at(v, fun, ..., na.rm = TRUE)

vline_0(..., na.rm = TRUE)

hline_0(..., na.rm = TRUE)

abline_01(..., na.rm = TRUE)

lbub(p, med = TRUE)

legend_move(position = "right")

legend_none()

legend_text(...)

xaxis_title(on = TRUE, ...)

xaxis_text(on = TRUE, ...)

xaxis_ticks(on = TRUE, ...)

yaxis_title(on = TRUE, ...)
```

```

yaxis_text(on = TRUE, ...)
yaxis_ticks(on = TRUE, ...)
facet_text(on = TRUE, ...)
facet_bg(on = TRUE, ...)
panel_bg(on = TRUE, ...)
plot_bg(on = TRUE, ...)
grid_lines(color = "gray50", size = 0.2)
overlay_function(...)

```

## Arguments

<code>v</code>	Either a numeric vector specifying the value(s) at which to draw the vertical or horizontal line(s), or an object of any type to use as the first argument to <code>fun</code> .
<code>fun</code>	A function, or the name of a function, that returns a numeric vector.
<code>...</code>	For the various <code>vline_</code> , <code>hline_</code> , and <code>abline_</code> functions, <code>...</code> is passed to <a href="#">geom_vline</a> , <a href="#">geom_hline</a> , and <a href="#">geom_abline</a> , respectively, to control the appearance of the line(s). For functions ending in <code>_bg</code> , <code>...</code> is passed to <a href="#">element_rect</a> . For functions ending in <code>_text</code> or <code>_title</code> , <code>...</code> is passed to <a href="#">element_text</a> . For <code>xaxis_ticks</code> and <code>yaxis_ticks</code> , <code>...</code> is passed to <a href="#">element_line</a> . For <code>overlay_function</code> , <code>...</code> is passed to <a href="#">stat_function</a> .
<code>na.rm</code>	A logical scalar passed to the appropriate geom (e.g. <a href="#">geom_vline</a> ). The default is <code>TRUE</code> .
<code>p</code>	The probability mass (in $[0,1]$ ) to include in the interval.
<code>med</code>	Should the median also be included in addition to the lower and upper bounds of the interval?
<code>position</code>	The position of the legend. Either a numeric vector (of length 2) giving the relative coordinates (between 0 and 1) for the legend, or a string among <code>"right"</code> , <code>"left"</code> , <code>"top"</code> , <code>"bottom"</code> . Using <code>position = "none"</code> is also allowed and is equivalent to using <code>legend_none()</code> .
<code>on</code>	For functions modifying ggplot <a href="#">theme</a> elements, set <code>on=FALSE</code> to set the element to <a href="#">element_blank</a> . For example, facet text can be removed by adding <code>facet_text(on=FALSE)</code> , or simply <code>facet_text(FALSE)</code> to a ggplot object. If <code>on=TRUE</code> (the default), then <code>...</code> can be used to customize the appearance of the theme element.
<code>color, size</code>	Passed to <a href="#">element_line</a> .

## Details

### Add vertical, horizontal, and diagonal lines to plots:

- `vline_at` and `hline_at` return an object created by either `geom_vline` or `geom_hline` that can be added to a `ggplot` object to draw a vertical or horizontal line (at one or several values). If `fun` is missing then the lines are drawn at the values in `v`. If `fun` is specified then the lines are drawn at the values returned by `fun(v)`.
- `vline_0` and `hline_0` are wrappers for `vline_at` and `hline_at` with `v = 0` and `fun` missing.
- `abline_01` is a wrapper for `geom_abline` with the intercept set to 0 and the slope set to 1.
- `lbub` returns a *function* that takes a single argument `x` and returns the lower and upper bounds (`lb`, `ub`) of the  $100 \times p\%$  central interval of `x`, as well as the median (if `med` is `TRUE`).

### Control appearance of facet strips:

- `facet_text` and `facet_bg` return `ggplot2` theme objects that can be added to an existing plot (`ggplot` object) to format the text and the background for the facet strips.

### Move legend, remove legend, or style the legend text:

- `legend_move` and `legend_none` return a `ggplot2` theme object that can be added to an existing plot (`ggplot` object) in order to change the position of the legend (`legend_move`) or remove the legend (`legend_none`). `legend_text` works much like `facet_text`, except it controls the legend text.

### Control appearance of *x*-axis and *y*-axis features:

- `xaxis_title` and `yaxis_title` return a `ggplot2` theme object that can be added to an existing plot (`ggplot` object) in order to toggle or format the titles displayed on the *x* or *y* axis. (To change the titles themselves use [labs](#).)
- `xaxis_text` and `yaxis_text` return a `ggplot2` theme object that can be added to an existing plot (`ggplot` object) in order to toggle or format the text displayed on the *x* or *y* axis (e.g. tick labels).
- `xaxis_ticks` and `yaxis_ticks` return a `ggplot2` theme object that can be added to an existing plot (`ggplot` object) to change the appearance of the axis tick marks.

### Customize plot background:

- `plot_bg` returns a `ggplot2` theme object that can be added to an existing plot (`ggplot` object) to format the background of the *entire* plot.
- `panel_bg` returns a `ggplot2` theme object that can be added to an existing plot (`ggplot` object) to format the background of the just the plotting area.
- `grid_lines` returns a `ggplot2` theme object that can be added to an existing plot (`ggplot` object) to add grid lines to the plot background.

### Superimpose a function on an existing plot:

- `overlay_function` is a simple wrapper for [stat\\_function](#) but with the `inherit.aes` argument fixed to `FALSE`. Fixing `inherit.aes=FALSE` will avoid potential errors due to the [aest](#)hetic mapping used by certain **bayesplot** plotting functions).

## Value

A **ggplot2** layer or [theme](#) object that can be added to existing `ggplot` objects, like those created by many of the **bayesplot** plotting functions. See the **Details** section.

**See Also**

[theme\\_default](#) for the default ggplot theme used by **bayesplot**.

**Examples**

```

color_scheme_set("gray")
x <- example_mcmc_draws(chains = 1)
dim(x)
colnames(x)

#####
### vertical & horizontal lines ###
#####

(p <- mcmc_intervals(x, regex_pars = "beta"))

# vertical line at zero (with some optional styling)
p + vline_0()
p + vline_0(size = 0.25, color = "darkgray", linetype = 2)

# vertical line(s) at specified values
v <- c(-0.5, 0, 0.5)
p + vline_at(v, linetype = 3, size = 0.25)

my_lines <- vline_at(v, alpha = 0.25, size = 0.75 * c(1, 2, 1),
                    color = c("maroon", "skyblue", "violet"))
p + my_lines

# add vertical line(s) at computed values
# (three ways of getting lines at column means)
color_scheme_set("brightblue")
p <- mcmc_intervals(x, regex_pars = "beta")
p + vline_at(x[, 3:4], colMeans)
p + vline_at(x[, 3:4], "colMeans", color = "darkgray",
            lty = 2, size = 0.25)
p + vline_at(x[, 3:4], function(a) apply(a, 2, mean),
            color = "orange",
            size = 2, alpha = 0.1)

# using the lbub function to get interval lower and upper bounds (lb, ub)
color_scheme_set("pink")
parsed <- ggplot2::label_parsed
p2 <- mcmc_hist(x, pars = "beta[1]", binwidth = 1/20,
              facet_args = list(labeler = parsed))
(p2 <- p2 + facet_text(size = 16))

b1 <- x[, "beta[1]"]
p2 + vline_at(b1, fun = lbub(0.8), color = "gray20",
              size = 2 * c(1,.5,1), alpha = 0.75)
p2 + vline_at(b1, lbub(0.8, med = FALSE), color = "gray20",

```

```

size = 2, alpha = 0.75)

#####
### format axis titles ###
#####
color_scheme_set("green")
y <- example_y_data()
yrep <- example_yrep_draws()
(p3 <- ppc_stat(y, yrep, stat = "median", binwidth = 1/4))

# turn off the legend, turn on x-axis title
p3 +
  legend_none() +
  xaxis_title(size = 13, family = "sans") +
  ggplot2::xlab(expression(italic(T(y)) == median(italic(y))))

#####
### format axis & facet text ###
#####
color_scheme_set("gray")
p4 <- mcmc_trace(example_mcmc_draws(), pars = c("alpha", "sigma"))

myfacets <-
  facet_bg(fill = "gray30", color = NA) +
  facet_text(face = "bold", color = "skyblue", size = 14)
p4 + myfacets

#####
### control tick marks ###
#####
p4 +
  myfacets +
  yaxis_text(FALSE) +
  yaxis_ticks(FALSE) +
  xaxis_ticks(size = 1, color = "skyblue")

#####
### change plot background ###
#####
color_scheme_set("blue")

# add grid lines
ppc_stat(y, yrep) + grid_lines()

# panel_bg vs plot_bg
ppc_scatter_avg(y, yrep) + panel_bg(fill = "gray90")
ppc_scatter_avg(y, yrep) + plot_bg(fill = "gray90")

color_scheme_set("yellow")

```

```

p5 <- ppc_scatter_avg(y, yrep, alpha = 1)
p5 + panel_bg(fill = "gray20") + grid_lines(color = "white")

color_scheme_set("purple")
ppc_dens_overlay(y, yrep[1:30, ]) +
  legend_text(size = 14) +
  legend_move(c(0.75, 0.5)) +
  plot_bg(fill = "gray90") +
  panel_bg(color = "black", fill = "gray99", size = 3)

#####
### superimpose a function on existing plot ###
#####
# compare posterior of beta[1] to Gaussian with same posterior mean
# and sd as beta[1]
x <- example_mcmc_draws(chains = 4)
dim(x)
purple_gaussian <-
  overlay_function(
    fun = dnorm,
    args = list(mean(x[, "beta[1]"], sd(x[, "beta[1]"])),
    color = "purple",
    size = 2
  )

color_scheme_set("gray")
mcmc_hist(x, pars = "beta[1]") + purple_gaussian
mcmc_dens(x, pars = "beta[1]") + purple_gaussian

```

---

bayesplot_grid	<i>Arrange plots in a grid</i>
----------------	--------------------------------

---

## Description

The `bayesplot_grid` function makes it simple to juxtapose plots using common  $x$  and/or  $y$  axes.

## Usage

```

bayesplot_grid(..., plots = list(), xlim = NULL, ylim = NULL,
  grid_args = list(), titles = character(), subtitles = character(),
  legends = TRUE, save_gg_objects = TRUE)

```

## Arguments

<code>...</code>	One or more ggplot objects.
<code>plots</code>	A list of ggplot objects. Can be used as an alternative to specifying plot objects via <code>...</code>

<code>xlim, ylim</code>	Optionally, numeric vectors of length 2 specifying lower and upper limits for the axes that will be shared across all plots.
<code>grid_args</code>	An optional named list of arguments to pass to <a href="#">arrangeGrob</a> (nrow, ncol, widths, etc.).
<code>titles, subtitles</code>	Optional character vectors of plot titles and subtitles. If specified, titles and subtitles must have length equal to the number of plots specified.
<code>legends</code>	If any of the plots have legends should they be displayed? Defaults to TRUE.
<code>save_gg_objects</code>	If TRUE, the default, then the ggplot objects specified in ... or via the plots argument are saved in a list in the "bayesplots" component of the returned object. Setting this to FALSE will make the returned object smaller but these individual plot objects will not be available.

### Value

An object of class "bayesplot\_grid" (essentially a gtable object from [arrangeGrob](#)), which has a plot method.

### Examples

```

y <- example_y_data()
yrep <- example_yrep_draws()
stats <- c("sd", "median", "max", "min")

color_scheme_set("pink")
bayesplot_grid(
  plots = lapply(stats, function(s) ppc_stat(y, yrep, stat = s)),
  titles = stats,
  legends = FALSE,
  grid_args = list(ncol = 1)
)

## Not run:
library(rstanarm)
mtcars$log_mpg <- log(mtcars$mpg)
fit1 <- stan_glm(mpg ~ wt, data = mtcars)
fit2 <- stan_glm(log_mpg ~ wt, data = mtcars)

y <- mtcars$mpg

yrep2 <- posterior_predict(fit2, fun = exp, draws = 50)

color_scheme_set("blue")
ppc1 <- ppc_dens_overlay(y, yrep1)
ppc1
ppc1 + yaxis_text()

color_scheme_set("red")
ppc2 <- ppc_dens_overlay(y, yrep2)

```

```

bayesplot_grid(ppc1, ppc2)

# make sure the plots use the same limits for the axes
bayesplot_grid(ppc1, ppc2, xlim = c(-5, 60), ylim = c(0, 0.2))

# remove the legends and add text
bayesplot_grid(ppc1, ppc2, xlim = c(-5, 60), ylim = c(0, 0.2),
               legends = FALSE, subtitles = rep("Predicted MPG", 2))

## End(Not run)

```

---

bayesplot_theme_get	<i>Get, set, and modify the active bayesplot theme</i>
---------------------	--

---

## Description

These functions are the **bayesplot** equivalent to **ggplot2**'s [theme\\_set](#) and friends. They set, get, and update the active theme but only apply them to bayesplots. The current/active theme is automatically applied to every bayesplot you draw.

Use `bayesplot_theme_get` to get the current **bayesplot** theme, and `bayesplot_theme_set` to change it. `bayesplot_theme_update` and `bayesplot_theme_replace` are shorthands for changing individual elements.

## Usage

```

bayesplot_theme_get()

bayesplot_theme_set(new = theme_default())

bayesplot_theme_update(...)

bayesplot_theme_replace(...)

```

## Arguments

new	The new theme (list of theme elements) to use. This is analogous to the new argument to <a href="#">theme_set</a> .
...	A named list of theme settings.

## Details

`bayesplot_theme_set` and friends only apply to bayesplots. However, `ggplot2::theme_set` can also be used to change the **bayesplot** theme. Currently, setting a theme with `ggplot2::theme_set` (other than the **ggplot2** default [theme\\_grey](#)) will override the **bayesplot** theme.

**Value**

`bayesplot_theme_get` returns the current theme. The other three functions (`set`, `update`, `replace`) invisibly return the *previous* theme so it can be saved and easily restored later. This is the same behavior as the **ggplot2** versions of these functions.

**See Also**

[theme\\_default](#) for the default **bayesplot** theme.

[bayesplot-helpers](#) for a variety of convenience functions, many of which provide shortcuts for tweaking theme elements after creating a plot.

[bayesplot-colors](#) to set or view the color scheme used for plotting.

**Examples**

```
library(ggplot2)

# plot using the current value of bayesplot_theme_get()
# (the default is bayesplot::theme_default())
x <- example_mcmc_draws()
mcmc_hist(x)

# change the bayesplot theme to theme_minimal and save the old theme
old <- bayesplot_theme_set(theme_minimal())
mcmc_hist(x)

# change back to the previous theme
bayesplot_theme_set(old)
mcmc_hist(x)

# change the default font size and family for bayesplots
bayesplot_theme_update(text = element_text(size = 16, family = "sans"))
mcmc_hist(x)

# change back to the default
bayesplot_theme_set() # same as bayesplot_theme_set(theme_default())
mcmc_hist(x)

# updating theme elements
color_scheme_set("brightblue")
bayesplot_theme_set(theme_dark())
mcmc_hist(x)

bayesplot_theme_update(panel.background = element_rect(fill = "black"))
mcmc_hist(x)

# to get the same plot without updating the theme we could also have
# used the bayesplot convenience function panel_bg()
bayesplot_theme_set(theme_dark())
mcmc_hist(x) + panel_bg(fill = "black")
```

MCMC-combos

*Combination plots***Description**

Combination plots

**Usage**

```
mcmc_combo(x, combo = c("dens", "trace"), widths = NULL, gg_theme = NULL,
  ...)
```

**Arguments**

x	A 3-D array, matrix, list of matrices, or data frame of MCMC draws. The <a href="#">MCMC-overview</a> page provides details on how to specify each these allowed inputs.
combo	A character vector with at least two elements. Each element of combo corresponds to a column in the resulting graphic and should be the name of one of the available <a href="#">MCMC</a> functions (omitting the <code>mcmc_</code> prefix).
widths	A numeric vector the same length as <code>combo</code> specifying relative column widths. For example, if the plot has two columns, then <code>widths = c(2, 1)</code> will allocate more space for the first column by a factor of 2 (as would <code>widths = c(.3, .15)</code> , etc.). The default, <code>NULL</code> , allocates the same horizontal space for each column.
gg_theme	Unlike most of the other <b>bayesplot</b> functions, <code>mcmc_combo</code> returns a <code>gtable</code> object rather than a <code>ggplot</code> object, and so theme objects can't be added directly to the returned plot object. The <code>gg_theme</code> argument helps get around this problem by accepting a <b>ggplot2</b> theme object that is added to each of the plots <i>before</i> combining them into the <code>gtable</code> object that is returned. This can be a theme object created by a call to <code>ggplot2::theme</code> or one of the <b>bayesplot</b> convenience functions, e.g. <a href="#">legend_none</a> (see the <b>Examples</b> section, below).
...	Arguments passed to the plotting functions named in <code>combo</code> .

**Value**

A `gtable` object (the result of calling [arrangeGrob](#)) with `length(combo)` columns and a row for each parameter.

**See Also**

## Examples

```
# some parameter draws to use for demonstration
x <- example_mcmc_draws()
dim(x)
dimnames(x)

mcmc_combo(x, pars = c("alpha", "sigma"))
mcmc_combo(x, pars = c("alpha", "sigma"), widths = c(1, 2))

# change second plot, show log(sigma) instead of sigma,
# and remove the legends
color_scheme_set("mix-blue-red")
mcmc_combo(
  x,
  combo = c("dens_overlay", "trace"),
  pars = c("alpha", "sigma"),
  transformations = list(sigma = "log"),
  gg_theme = legend_none()
)

# same thing but this time also change the entire ggplot theme
mcmc_combo(
  x,
  combo = c("dens_overlay", "trace"),
  pars = c("alpha", "sigma"),
  transformations = list(sigma = "log"),
  gg_theme = ggplot2::theme_gray() + legend_none()
)
```

---

MCMC-diagnostics

*General MCMC diagnostics*

---

## Description

Plots of Rhat statistics, ratios of effective sample size to total sample size, and autocorrelation of MCMC draws. See the **Plot Descriptions** section, below, for details. For models fit using the No-U-Turn-Sampler, see also [MCMC-nuts](#) for additional MCMC diagnostic plots.

## Usage

```
mcmc_rhat(rhat, ..., size = NULL)

mcmc_rhat_hist(rhat, ..., binwidth = NULL, breaks = NULL)

mcmc_rhat_data(rhat, ...)
```

```

mcmc_neff(ratio, ..., size = NULL)

mcmc_neff_hist(ratio, ..., binwidth = NULL, breaks = NULL)

mcmc_neff_data(ratio, ...)

mcmc_acf(x, pars = character(), regex_pars = character(),
  facet_args = list(), ..., lags = 20, size = NULL)

mcmc_acf_bar(x, pars = character(), regex_pars = character(),
  facet_args = list(), ..., lags = 20)

```

### Arguments

<code>rhat</code>	A vector of <a href="#">Rhat</a> estimates.
<code>...</code>	Currently ignored.
<code>size</code>	An optional value to override <a href="#">geom_point</a> 's default size (for <code>mcmc_rhat</code> , <code>mcmc_neff</code> ) or <a href="#">geom_line</a> 's default size (for <code>mcmc_acf</code> ).
<code>binwidth</code>	Passed to <a href="#">geom_histogram</a> to override the default binwidth.
<code>breaks</code>	Passed to <a href="#">geom_histogram</a> as an alternative to binwidth.
<code>ratio</code>	A vector of <i>ratios</i> of effective sample size estimates to total sample size. See <a href="#">neff_ratio</a> .
<code>x</code>	A 3-D array, matrix, list of matrices, or data frame of MCMC draws. The <a href="#">MCMC-overview</a> page provides details on how to specify each these allowed inputs.
<code>pars</code>	An optional character vector of parameter names. If neither <code>pars</code> nor <code>regex_pars</code> is specified then the default is to use <i>all</i> parameters.
<code>regex_pars</code>	An optional <a href="#">regular expression</a> to use for parameter selection. Can be specified instead of <code>pars</code> or in addition to <code>pars</code> .
<code>facet_args</code>	A named list of arguments (other than facets) passed to <a href="#">facet_wrap</a> or <a href="#">facet_grid</a> to control faceting.
<code>lags</code>	The number of lags to show in the autocorrelation plot.

### Value

A ggplot object that can be further customized using the **ggplot2** package. The `_data` functions return the data that would have been drawn by the plotting function.

### Plot Descriptions

`mcmc_rhat`, `mcmc_rhat_hist` Rhat values as either points or a histogram. Values are colored using different shades (lighter is better). The chosen thresholds are somewhat arbitrary, but can be useful guidelines in practice.

- *light*: below 1.05 (good)
- *mid*: between 1.05 and 1.1 (ok)
- *dark*: above 1.1 (too high)

`mcmc_neff`, `mcmc_neff_hist` Ratios of effective sample size to total sample size as either points or a histogram. Values are colored using different shades (lighter is better). The chosen thresholds are somewhat arbitrary, but can be useful guidelines in practice.

- *light*: between 0.5 and 1 (high)
- *mid*: between 0.1 and 0.5 (good)
- *dark*: below 0.1 (low)

`mcmc_acf` Grid of autocorrelation plots by chain and parameter. The `lags` argument gives the maximum number of lags at which to calculate the autocorrelation function. `mcmc_acf` is a line plot whereas `mcmc_acf_bar` is a barplot.

mcmc_rhat(rhat(fit2))
mcmc_neff(neff_ratio(fit2))
mcmc_acf(as.array(fit2), pars = c("wt", "cyl"), lags = 10)

## End(Not run)

```

## Description

Various types of histograms and kernel density plots of MCMC draws. See the **Plot Descriptions** section, below, for details.

**Usage**

```

mcmc_hist(x, pars = character(), regex_pars = character(),
  transformations = list(), facet_args = list(), ..., binwidth = NULL,
  breaks = NULL, freq = TRUE)

mcmc_dens(x, pars = character(), regex_pars = character(),
  transformations = list(), facet_args = list(), ..., trim = FALSE)

mcmc_hist_by_chain(x, pars = character(), regex_pars = character(),
  transformations = list(), facet_args = list(), ..., binwidth = NULL,
  freq = TRUE)

mcmc_dens_overlay(x, pars = character(), regex_pars = character(),
  transformations = list(), facet_args = list(), color_chains = TRUE, ...,
  trim = FALSE)

mcmc_dens_chains(x, pars = character(), regex_pars = character(),
  transformations = list(), color_chains = TRUE, ..., bw = NULL,
  adjust = NULL, kernel = NULL, n_dens = NULL)

mcmc_dens_chains_data(x, pars = character(), regex_pars = character(),
  transformations = list(), ..., bw = NULL, adjust = NULL,
  kernel = NULL, n_dens = NULL)

mcmc_violin(x, pars = character(), regex_pars = character(),
  transformations = list(), facet_args = list(), ..., probs = c(0.1, 0.5,
  0.9))

```

**Arguments**

<code>x</code>	A 3-D array, matrix, list of matrices, or data frame of MCMC draws. The <a href="#">MCMC-overview</a> page provides details on how to specify each these allowed inputs.
<code>pars</code>	An optional character vector of parameter names. If neither <code>pars</code> nor <code>regex_pars</code> is specified then the default is to use <i>all</i> parameters.
<code>regex_pars</code>	An optional <a href="#">regular expression</a> to use for parameter selection. Can be specified instead of <code>pars</code> or in addition to <code>pars</code> .
<code>transformations</code>	Optionally, transformations to apply to parameters before plotting. If <code>transformations</code> is a function or a single string naming a function then that function will be used to transform all parameters. To apply transformations to particular parameters, the <code>transformations</code> argument can be a named list with length equal to the number of parameters to be transformed. Currently only univariate transformations of scalar parameters can be specified (multivariate transformations will be implemented in a future release). If <code>transformations</code> is a list, the name of each list element should be a parameter name and the content of each list element should be a function (or any item to match as a function via <a href="#">match.fun</a> ,

e.g. a string naming a function). If a function is specified by its name as a string (e.g. "log"), then it can be used to construct a new parameter label for the appropriate parameter (e.g. "log(sigma)"). If a function itself is specified (e.g. log or function(x) log(x)) then "t" is used in the new parameter label to indicate that the parameter is transformed (e.g. "t(sigma)").

Note: due to partial argument matching transformations can be abbreviated for convenience in interactive use (e.g., transform, trans, etc.).

facet_args	A named list of arguments (other than facets) passed to <a href="#">facet_wrap</a> or <a href="#">facet_grid</a> to control faceting.
...	Currently ignored.
binwidth	Passed to <a href="#">geom_histogram</a> to override the default binwidth.
breaks	Passed to <a href="#">geom_histogram</a> as an alternative to binwidth.
freq	For histograms, freq=TRUE (the default) puts count on the y-axis. Setting freq=FALSE puts density on the y-axis. (For many plots the y-axis text is off by default. To view the count or density labels on the y-axis see the <a href="#">yaxis_text</a> convenience function.)
trim	A logical scalar passed to <a href="#">geom_density</a> .
color_chains	option for whether to separately color chains.
bw, adjust, kernel, n_dens	Optional arguments passed to <a href="#">density</a> to override default kernel density estimation parameters. n_dens defaults to 1024.
probs	A numeric vector passed to <a href="#">geom_violin</a> 's draw_quantiles argument to specify at which quantiles to draw horizontal lines. Set to NULL to remove the lines.

### Value

A ggplot object that can be further customized using the **ggplot2** package.

### Plot Descriptions

mcmc_hist	Histograms of posterior draws with all chains merged.
mcmc_dens	Kernel density plots of posterior draws with all chains merged.
mcmc_hist_by_chain	Histograms of posterior draws with chains separated via faceting.
mcmc_dens_overlay	Kernel density plots of posterior draws with chains separated but overlaid on a single plot.
mcmc_violin	The density estimate of each chain is plotted as a violin with horizontal lines at notable quantiles.
mcmc_dens_chains	Ridgeline kernel density plots of posterior draws with chains separated but overlaid on a single plot. In mcmc_dens_overlay parameters appear in separate facets; in mcmc_dens_chains they appear in the same panel and can overlap vertically.

MCMC-intervals

*Plot interval estimates from MCMC draws*

## Description

Plot central (quantile-based) posterior interval estimates from MCMC draws. See the **Plot Descriptions** section, below, for details.

## Usage

```
mcmc_intervals(x, pars = character(), regex_pars = character(),
  transformations = list(), ..., prob = 0.5, prob_outer = 0.9,
  point_est = c("median", "mean", "none"), rhat = numeric())

mcmc_areas(x, pars = character(), regex_pars = character(),
  transformations = list(), ..., prob = 0.5, prob_outer = 1,
  point_est = c("median", "mean", "none"), rhat = numeric(), bw = NULL,
  adjust = NULL, kernel = NULL, n_dens = NULL)

mcmc_areas_ridges(x, pars = character(), regex_pars = character(),
  transformations = list(), ..., prob_outer = 1, prob = 1, bw = NULL,
  adjust = NULL, kernel = NULL, n_dens = NULL)

mcmc_intervals_data(x, pars = character(), regex_pars = character(),
  transformations = list(), ..., prob = 0.5, prob_outer = 0.9,
  point_est = c("median", "mean", "none"), rhat = numeric())

mcmc_areas_data(x, pars = character(), regex_pars = character(),
  transformations = list(), ..., prob = 0.5, prob_outer = 1,
  point_est = c("median", "mean", "none"), rhat = numeric(), bw = NULL,
  adjust = NULL, kernel = NULL, n_dens = NULL)

mcmc_areas_ridges_data(x, pars = character(), regex_pars = character(),
  transformations = list(), ..., prob_outer = 1, prob = 1, bw = NULL,
  adjust = NULL, kernel = NULL, n_dens = NULL)
```

## Arguments

<code>x</code>	A 3-D array, matrix, list of matrices, or data frame of MCMC draws. The <a href="#">MCMC-overview</a> page provides details on how to specify each these allowed inputs.
<code>pars</code>	An optional character vector of parameter names. If neither <code>pars</code> nor <code>regex_pars</code> is specified then the default is to use <i>all</i> parameters.

<code>regex_pars</code>	An optional <a href="#">regular expression</a> to use for parameter selection. Can be specified instead of <code>pars</code> or in addition to <code>pars</code> .
<code>transformations</code>	<p>Optionally, transformations to apply to parameters before plotting. If <code>transformations</code> is a function or a single string naming a function then that function will be used to transform all parameters. To apply transformations to particular parameters, the <code>transformations</code> argument can be a named list with length equal to the number of parameters to be transformed. Currently only univariate transformations of scalar parameters can be specified (multivariate transformations will be implemented in a future release). If <code>transformations</code> is a list, the name of each list element should be a parameter name and the content of each list element should be a function (or any item to match as a function via <a href="#">match.fun</a>, e.g. a string naming a function). If a function is specified by its name as a string (e.g. "log"), then it can be used to construct a new parameter label for the appropriate parameter (e.g. "log(sigma)"). If a function itself is specified (e.g. log or function(x) log(x)) then "t" is used in the new parameter label to indicate that the parameter is transformed (e.g. "t(sigma)").</p> <p>Note: due to partial argument matching transformations can be abbreviated for convenience in interactive use (e.g., transform, trans, etc.).</p>
<code>...</code>	Currently unused.
<code>prob</code>	The probability mass to include in the inner interval (for <code>mcmc_intervals</code> ) or in the shaded region (for <code>mcmc_areas</code> ). The default is 0.5 (50% interval) and 1 for <code>mcmc_areas_ridges</code> .
<code>prob_outer</code>	The probability mass to include in the outer interval. The default is 0.9 for <code>mcmc_intervals</code> (90% interval) and 1 for <code>mcmc_areas</code> and for <code>mcmc_areas_ridges</code> .
<code>point_est</code>	The point estimate to show. Either "median" (the default), "mean", or "none".
<code>rhat</code>	An optional numeric vector of $\hat{R}$ estimates, with one element per parameter included in <code>x</code> . If <code>rhat</code> is provided, the intervals/areas and point estimates in the resulting plot are colored based on $\hat{R}$ value. See <a href="#">rhat</a> for methods for extracting $\hat{R}$ estimates.
<code>bw, adjust, kernel, n_dens</code>	Optional arguments passed to <a href="#">density</a> to override default kernel density estimation parameters. <code>n_dens</code> defaults to 1024.

## Value

A `ggplot` object that can be further customized using the **ggplot2** package. The `_data` functions return the data that would have been drawn by the plotting function.

## Plot Descriptions

- `mcmc_intervals` Plots of uncertainty intervals computed from posterior draws with all chains merged.
- `mcmc_areas` Density plots computed from posterior draws with all chains merged, with uncertainty intervals shown as shaded areas under the curves.
- `mcmc_areas_ridges` Density plot, as in `mcmc_areas`, but drawn with overlapping ridgelines. This plot provides a compact display of (hierarchically) related distributions.

  ggplot2::ggtitle("Treatment effect on eight schools (Rubin, 1981)")

## End(Not run)

```

---

MCMC-nuts

---

*Diagnostic plots for the No-U-Turn-Sampler (NUTS)*

---

## Description

Diagnostic plots for the No-U-Turn-Sampler (NUTS), the default MCMC algorithm used by Stan. See the **Plot Descriptions** section, below.

## Usage

```

mcmc_nuts_acceptance(x, lp, chain = NULL, ..., binwidth = NULL)

mcmc_nuts_divergence(x, lp, chain = NULL, ...)

mcmc_nuts_stepsize(x, lp, chain = NULL, ...)

mcmc_nuts_treedepth(x, lp, chain = NULL, ...)

mcmc_nuts_energy(x, ..., binwidth = NULL, alpha = 0.5,
  merge_chains = FALSE)

```

**Arguments**

x	A molten data frame of NUTS sampler parameters, either created by <code>nuts_params</code> or in the same form as the object returned by <code>nuts_params</code> .
lp	A molten data frame of draws of the log-posterior or, more commonly, of a quantity equal to the log-posterior up to a constant. <code>lp</code> should either be created via <code>log_posterior</code> or be an object with the same form as the object returned by <code>log_posterior</code> .
chain	A positive integer for selecting a particular chain. The default (NULL) is to merge the chains before plotting. If <code>chain = k</code> then the plot for chain <code>k</code> is overlaid (in a darker shade but with transparency) on top of the plot for all chains. The <code>chain</code> argument is not used by <code>mcmc_nuts_energy</code> .
...	Currently ignored.
binwidth	An optional value passed to <code>geom_histogram</code> to override the default binwidth.
alpha	For <code>mcmc_nuts_energy</code> only, the transparency (alpha) level in [0,1] used for the overlaid histogram.
merge_chains	For <code>mcmc_nuts_energy</code> only, should all chains be merged or displayed separately? The default is FALSE, i.e., to show the chains separately.

**Value**

A `gtable` object (the result of calling `arrangeGrob`) created from several `ggplot` objects, except for `mcmc_nuts_energy`, which returns a `ggplot` object.

**Quick Definitions**

For more details see Stan Development Team (2016) and Betancourt (2017).

- `accept_stat__`: the average acceptance probabilities of all possible samples in the proposed tree.
- `divergent__`: the number of leapfrog transitions with diverging error. Because NUTS terminates at the first divergence this will be either 0 or 1 for each iteration.
- `stepsize__`: the step size used by NUTS in its Hamiltonian simulation.
- `treedepth__`: the depth of tree used by NUTS, which is the log (base 2) of the number of leapfrog steps taken during the Hamiltonian simulation.
- `energy__`: the value of the Hamiltonian (up to an additive constant) at each iteration.

**Plot Descriptions**

`mcmc_nuts_acceptance` Three plots:

- Histogram of `accept_stat__` with vertical lines indicating the mean (solid line) and median (dashed line).
- Histogram of `lp__` with vertical lines indicating the mean (solid line) and median (dashed line).
- Scatterplot of `accept_stat__` vs `lp__`.

`mcmc_nuts_divergence` Two plots:

- Violin plots of `lp__|divergent__=1` and `lp__|divergent__=0`.
- Violin plots of `accept_stat__|divergent__=1` and `accept_stat__|divergent__=0`.

`mcmc_nuts_stepsize` Two plots:

- Violin plots of `lp__` by chain ordered by `stepsize__` value.
- Violin plots of `accept_stat__` by chain ordered by `stepsize__` value.

`mcmc_nuts_treedepth` Three plots:

- Violin plots of `lp__` by value of `treedepth__`.
- Violin plots of `accept_stat__` by value of `treedepth__`.
- Histogram of `treedepth__`.

`mcmc_nuts_energy` Overlaid histograms showing `energy__` vs the change in `energy__`. See Betancourt (2016) for details.

## See Also

- The *Visual MCMC Diagnostics* vignette.
- Several other plotting functions in the **bayesplot** package are not NUTS-specific but take optional extra arguments if the model was fit using NUTS:
  - `mcmc_trace`: show divergences as tick marks below the trace plot.
  - `mcmc_parcoord`: change the color/size/transparency of lines corresponding to divergences.
  - `mcmc_scatter`: change the color/size/shape of points corresponding to divergences.
  - `mcmc_pairs`: change the color/size/shape of points corresponding divergences and/or max treedepth saturation.

## End(Not run)

```

## Description

The **bayesplot** MCMC module provides various plotting functions for creating graphical displays of Markov chain Monte Carlo (MCMC) simulations. The **MCMC plotting functions** section, below, provides links to the documentation for various categories of MCMC plots. Currently the MCMC plotting functions accept posterior draws provided in one of the following formats:

- **3-D array:** An [array](#) with dimensions [Iteration, Chain, Parameter] in that order.
- **list:** A list of matrices, where each matrix corresponds to a Markov chain. All of the matrices should have the same number of iterations (rows) and parameters (columns), and parameters should have the same names and be in the same order.
- **matrix:** A [matrix](#) with one column per parameter. If using matrix there should only be a single Markov chain or all chains should already be merged (stacked).
- **data frame:** There are two types of [data frames](#) allowed. Either a data frame with one column per parameter (if only a single chain or all chains have already been merged), or a data frame with one column per parameter plus an additional column "Chain" that contains the chain number (an integer) corresponding to each row in the data frame.

**Note:** typically the user should *not* include warmup iterations in the object passed to **bayesplot** plotting functions, although for certain plots (e.g. trace plots) it can occasionally be useful to include the warmup iterations for diagnostic purposes.

## MCMC plotting functions

**Posterior distributions** Histograms and kernel density plots of parameter draws, optionally showing each Markov chain separately.

**Uncertainty intervals** Uncertainty intervals computed from parameter draws.

**Trace plots** Times series of parameter draws, optionally including with HMC/NUTS diagnostic information.

**Scatterplots** Scatterplots, heatmaps, and pairs plots of parameter draws, optionally including with HMC/NUTS diagnostic information.

**Parallel coordinates plots** Parallel coordinates plot of MCMC draws (one dimension per parameter), optionally including with HMC/NUTS diagnostic information.

**Combinations** Combination plots (e.g. trace plot + histogram).

**General MCMC diagnostics** MCMC diagnostic plots including Rhat, effective sample size, autocorrelation.

**NUTS diagnostics** Special diagnostic plots for the No-U-Turn Sampler.

**Comparisons to "true" values** Plots comparing MCMC estimates to "true" parameter values (e.g., values used to simulate data).

---

MCMC-parcoord

*Parallel coordinates plot of MCMC draws*

---

## Description

Parallel coordinates plot of MCMC draws (one dimension per parameter). See the **Plot Descriptions** section, below, for details.

## Usage

```
mcmc_parcoord(x, pars = character(), regex_pars = character(),
  transformations = list(), ..., size = 0.2, alpha = 0.3, np = NULL,
  np_style = parcoord_style_np())
```

```
mcmc_parcoord_data(x, pars = character(), regex_pars = character(),
  transformations = list(), np = NULL)
```

```
parcoord_style_np(div_color = "red", div_size = 0.2, div_alpha = 0.2)
```

## Arguments

<code>x</code>	A 3-D array, matrix, list of matrices, or data frame of MCMC draws. The <a href="#">MCMC-overview</a> page provides details on how to specify each these allowed inputs.
<code>pars</code>	An optional character vector of parameter names. If neither <code>pars</code> nor <code>regex_pars</code> is specified then the default is to use <i>all</i> parameters.
<code>regex_pars</code>	An optional <a href="#">regular expression</a> to use for parameter selection. Can be specified instead of <code>pars</code> or in addition to <code>pars</code> .
<code>transformations</code>	<p>Optionally, transformations to apply to parameters before plotting. If <code>transformations</code> is a function or a single string naming a function then that function will be used to transform all parameters. To apply transformations to particular parameters, the <code>transformations</code> argument can be a named list with length equal to the number of parameters to be transformed. Currently only univariate transformations of scalar parameters can be specified (multivariate transformations will be implemented in a future release). If <code>transformations</code> is a list, the name of each list element should be a parameter name and the content of each list element should be a function (or any item to match as a function via <a href="#">match.fun</a>, e.g. a string naming a function). If a function is specified by its name as a string (e.g. "log"), then it can be used to construct a new parameter label for the appropriate parameter (e.g. "log(sigma)"). If a function itself is specified (e.g. <code>log</code> or <code>function(x) log(x)</code>) then "t" is used in the new parameter label to indicate that the parameter is transformed (e.g. "t(sigma)").</p> <p>Note: due to partial argument matching transformations can be abbreviated for convenience in interactive use (e.g., <code>transform</code>, <code>trans</code>, etc.).</p>
<code>...</code>	Currently ignored.
<code>size, alpha</code>	Arguments passed on to <a href="#">geom_line</a> .
<code>np</code>	For models fit using <a href="#">NUTS</a> (more generally, any <a href="#">symplectic integrator</a> ), an optional data frame providing NUTS diagnostic information. The data frame should be the object returned by <a href="#">nuts_params</a> or one with the same structure.
<code>np_style</code>	A call to the <code>parcoord_style_np</code> helper function to specify arguments controlling the appearance of superimposed lines representing NUTS diagnostics (in this case divergences) if the <code>np</code> argument is specified.
<code>div_color, div_size, div_alpha</code>	Optional arguments to the <code>parcoord_style_np</code> helper function that are eventually passed to <a href="#">geom_line</a> if the <code>np</code> argument is also specified. They control the color, size, and transparency specifications for showing divergences in the plot. The default values are displayed in the <b>Usage</b> section above.

## Value

A ggplot object that can be further customized using the **ggplot2** package. The `_data` functions return the data that would have been drawn by the plotting function.

## Plot Descriptions

`mcmc_parcoord` (**Parallel coordinates plot**) of MCMC draws. There is one dimension per parameter along the horizontal axis and each set of connected line segments represents a single MCMC draw (i.e., a vector of length equal to the number of parameters).

The parallel coordinates plot is most useful if the optional HMC/NUTS diagnostic information is provided via the `np` argument. In that case divergences are highlighted in the plot. The appearance of the divergences can be customized using the `np_style` argument and the `parcoord_style_np` helper function.

When the plotted model parameters are on very different scales the `transformations` argument can be useful. For example, to standardize all variables before plotting you could use function  $(x - \text{mean}(x)) / \text{sd}(x)$  when specifying the `transformations` argument to `mcmc_parcoord`. See the **Examples** section for how to do this.

## Examples

```
color_scheme_set("pink")
x <- example_mcmc_draws(params = 5)
mcmc_parcoord(x)
mcmc_parcoord(x, regex_pars = "beta")

## Not run:
# Example using a Stan demo model
library(rstan)
fit <- stan_demo("eight_schools")
draws <- as.array(fit, pars = c("mu", "tau", "theta", "lp__"))
np <- nuts_params(fit)
str(np)
levels(np$Parameter)

color_scheme_set("brightblue")
mcmc_parcoord(draws, alpha = 0.05)
mcmc_parcoord(draws, np = np)

# customize appearance of divergences
color_scheme_set("darkgray")
div_style <- parcoord_style_np(div_color = "green", div_size = 0.05, div_alpha = 0.4)
mcmc_parcoord(draws, size = 0.25, alpha = 0.1,
```

```

      np = np, np_style = div_style)

# to use a transformation (e.g., to standardize all the variables)
# specify the 'transformations' argument (though partial argument name
# matching means we can just use 'trans' or 'transform')
mcmc_parcoord(
  draws,
  transform = function(x) {(x - mean(x)) / sd(x)},
  size = 0.25,
  alpha = 0.1,
  np = np,
  np_style = div_style
)

# mcmc_parcoord_data returns just the data in a convenient form for plotting
d <- mcmc_parcoord_data(x, np = np)
head(d)
tail(d)

## End(Not run)

```

---

MCMC-recover

---

*Compare MCMC estimates to "true" parameter values*

---

## Description

Plots comparing MCMC estimates to "true" parameter values. Before fitting a model to real data it is useful to simulate data according to the model using known (fixed) parameter values and to check that these "true" parameter values are (approximately) recovered by fitting the model to the simulated data. See the **Plot Descriptions** section, below, for details on the available plots.

## Usage

```

mcmc_recover_intervals(x, true, batch = rep(1, length(true)),
  facet_args = list(), ..., prob = 0.5, prob_outer = 0.9,
  point_est = c("median", "mean", "none"), size = 4, alpha = 1)

mcmc_recover_scatter(x, true, batch = rep(1, length(true)),
  facet_args = list(), ..., point_est = c("median", "mean"), size = 3,
  alpha = 1)

mcmc_recover_hist(x, true, facet_args = list(), ..., binwidth = NULL,
  breaks = NULL)

```

## Arguments

**x** A 3-D array, matrix, list of matrices, or data frame of MCMC draws. The [MCMC-overview](#) page provides details on how to specify each these allowed inputs.

<code>true</code>	A numeric vector of "true" values of the parameters in <code>x</code> . There should be one value in <code>true</code> for each parameter included in <code>x</code> and the order of the parameters in <code>true</code> should be the same as the order of the parameters in <code>x</code> .
<code>batch</code>	Optionally, a vector-like object (numeric, character, integer, factor) used to split the parameters into batches. If <code>batch</code> is specified, it must have the same length as <code>true</code> and be in the same order as <code>true</code> . Parameters in the same batch will be grouped together in the same facet in the plot (see the <b>Examples</b> section, below). The default is to group all parameters together into a single batch. Changing the default is most useful when parameters are on very different scales, in which case <code>batch</code> can be used to group them into batches within which it makes sense to use the same <i>y</i> -axis.
<code>facet_args</code>	A named list of arguments (other than facets) passed to <a href="#">facet_wrap</a> or <a href="#">facet_grid</a> to control faceting.
<code>...</code>	Currently unused.
<code>prob</code>	The probability mass to include in the inner interval. The default is 0.5 (50% interval).
<code>prob_outer</code>	The probability mass to include in the outer interval. The default is 0.9 (90% interval).
<code>point_est</code>	The point estimate to show. Either "median" (the default), "mean", or "none".
<code>size, alpha</code>	Passed to <a href="#">geom_point</a> to control the appearance of plotted points.
<code>binwidth</code>	Passed to <a href="#">geom_histogram</a> to override the default binwidth.
<code>breaks</code>	Passed to <a href="#">geom_histogram</a> as an alternative to binwidth.

### Value

A ggplot object that can be further customized using the **ggplot2** package.

### Plot Descriptions

`mcmc_recover_intervals` Central intervals and point estimates computed from MCMC draws, with "true" values plotted using a different shape.

`mcmc_recover_scatter` Scatterplot of posterior means (or medians) against "true" values.

`mcmc_recover_hist` Histograms of the draws for each parameter with the "true" value overlaid as a vertical line.

### See Also

Other MCMC: [MCMC-combos](#), [MCMC-diagnostics](#), [MCMC-distributions](#), [MCMC-intervals](#), [MCMC-nuts](#), [MCMC-overview](#), [MCMC-parcoord](#), [MCMC-scatterplots](#), [MCMC-traces](#)

### Examples

```
## Not run:
library(rstanarm)
alpha <- 1; beta <- rnorm(10, 0, 3); sigma <- 2
X <- matrix(rnorm(1000), 100, 10)
```

```

y <- rnorm(100, mean = c(alpha + X %*% beta), sd = sigma)
fit <- stan_glm(y ~ ., data = data.frame(y, X))
draws <- as.matrix(fit)
print(colnames(draws))
true <- c(alpha, beta, sigma)

mcmc_recover_intervals(draws, true)

# put the coefficients on X into the same batch
mcmc_recover_intervals(draws, true, batch = c(1, rep(2, 10), 1))
# equivalent
mcmc_recover_intervals(draws, true, batch = grepl("X", colnames(draws)))
# same but facets stacked vertically
mcmc_recover_intervals(draws, true,
                        batch = grepl("X", colnames(draws)),
                        facet_args = list(ncol = 1),
                        size = 3)

# each parameter in its own facet
mcmc_recover_intervals(draws, true, batch = 1:ncol(draws))
# same but in a different order
mcmc_recover_intervals(draws, true, batch = c(1, 3, 4, 2, 5:12))
# present as bias by centering with true values
mcmc_recover_intervals(sweep(draws, 2, true), rep(0, ncol(draws))) + hline_0()

# scatterplot of posterior means vs true values
mcmc_recover_scatter(draws, true, point_est = "mean")

# histograms of parameter draws with true value added as vertical line
color_scheme_set("brightblue")
mcmc_recover_hist(draws[, 1:4], true[1:4])

## End(Not run)

```

## Description

Scatterplots, hexagonal heatmaps, and pairs plots from MCMC draws. See the **Plot Descriptions** section, below, for details.

## Usage

```

mcmc_scatter(x, pars = character(), regex_pars = character(),
             transformations = list(), ..., size = 2.5, alpha = 0.8, np = NULL,
             np_style = scatter_style_np())

```

```

mcmc_hex(x, pars = character(), regex_pars = character(),
         transformations = list(), ..., binwidth = NULL)

mcmc_pairs(x, pars = character(), regex_pars = character(),
           transformations = list(), ..., diag_fun = c("hist", "dens"),
           off_diag_fun = c("scatter", "hex"), diag_args = list(),
           off_diag_args = list(), condition = pairs_condition(), lp = NULL,
           np = NULL, np_style = pairs_style_np(), max_treedepth = NULL,
           grid_args = list(), save_gg_objects = TRUE)

                 div_alpha = 1)

pairs_style_np(div_color = "red", div_shape = 4, div_size = 1,
               div_alpha = 1, td_color = "yellow2", td_shape = 3, td_size = 1,
               td_alpha = 1)

pairs_condition(chains = NULL, draws = NULL, nuts = NULL)

```

## Arguments

<code>x</code>	A 3-D array, matrix, list of matrices, or data frame of MCMC draws. The <a href="#">MCMC-overview</a> page provides details on how to specify each these allowed inputs.
<code>pars</code>	An optional character vector of parameter names. For <code>mcmc_scatter</code> and <code>mcmc_hex</code> only two parameters can be selected. To plot more than two parameters use <code>mcmc_pairs</code> .
<code>regex_pars</code>	An optional <a href="#">regular expression</a> to use for parameter selection. Can be specified instead of <code>pars</code> or in addition to <code>pars</code> .
<code>transformations</code>	<p>Optionally, transformations to apply to parameters before plotting. If <code>transformations</code> is a function or a single string naming a function then that function will be used to transform all parameters. To apply transformations to particular parameters, the <code>transformations</code> argument can be a named list with length equal to the number of parameters to be transformed. Currently only univariate transformations of scalar parameters can be specified (multivariate transformations will be implemented in a future release). If <code>transformations</code> is a list, the name of each list element should be a parameter name and the content of each list element should be a function (or any item to match as a function via <a href="#">match.fun</a>, e.g. a string naming a function). If a function is specified by its name as a string (e.g. "log"), then it can be used to construct a new parameter label for the appropriate parameter (e.g. "log(sigma)"). If a function itself is specified (e.g. <code>log</code> or <code>function(x) log(x)</code>) then "t" is used in the new parameter label to indicate that the parameter is transformed (e.g. "t(sigma)").</p> <p>Note: due to partial argument matching transformations can be abbreviated for convenience in interactive use (e.g., <code>transform</code>, <code>trans</code>, etc.).</p>
<code>...</code>	Currently ignored.

size, alpha	For <code>mcmc_scatter</code> , passed to <code>geom_point</code> to control the appearance of the points.
np	Optionally, a data frame of NUTS sampler parameters, either created by <code>nuts_params</code> or in the same form as the object returned by <code>nuts_params</code> . The colors, shapes, and sizes of the superimposed points can be customized using the <code>np_style</code> argument.
np_style	If <code>np</code> is specified, <code>np_style</code> can be a call to the <code>scatter_style_np</code> helper function (for <code>mcmc_scatter</code> ) or the <code>pairs_style_np</code> helper function (for <code>mcmc_pars</code> ) to specify arguments controlling the appearance of superimposed points representing NUTS diagnostic information. (Note: for <code>pairs_style_np</code> the size arguments are interpreted as scaling factors).
binwidth	For <code>mcmc_hex</code> , an optional numeric vector of <i>length two</i> passed to <code>geom_hex</code> to override the default binwidth in both the vertical and horizontal directions.
diag_fun, off_diag_fun	For <code>mcmc_pairs</code> , the plotting function to use for the plots along the diagonal and for the off-diagonal plots, respectively. Currently <code>diag_fun</code> can be "hist" for histogram or "dens" for density, and <code>off_diag_fun</code> can be "scatter" for scatterplot or "hex" for a hexagonal heatmap.
diag_args, off_diag_args	For <code>mcmc_pairs</code> , optional named lists of arguments to pass to the functions implied by the <code>diag_fun</code> and <code>off_diag_fun</code> arguments, respectively. For example, if <code>off_diag_fun</code> is "scatter" then <code>off_diag_args</code> could include optional arguments to <code>mcmc_scatter</code> like <code>size</code> and <code>alpha</code> .
condition	For <code>mcmc_pairs</code> , a call to the <code>pairs_condition</code> helper function, which is used to specify a criterion for determining which chains (or iterations) are shown in the plots above the diagonal and which are shown in the plots below the diagonal. The histograms (or density plots) along the diagonal are always made using all chains and iterations, but the scatterplots (or hex plots) above and below the diagonal show different combinations of chains/iterations depending on condition. The default is a call to <code>pairs_condition</code> with none of its arguments specified. In this case half of the chains (or roughly half if there are an odd number) will be used in the plots above the diagonal and the rest in the plots below the diagonal. The chains, draws, and nuts arguments to <code>pairs_condition</code> , which are documented below, can be used to change this default.
lp	For <code>mcmc_pairs</code> , a molten data frame of draws of the log-posterior or, more commonly, of a quantity equal to the log-posterior up to a constant. <code>lp</code> should either be created via <code>log_posterior</code> or be an object with the same form as the object returned by <code>log_posterior</code> .
max_tredepth	For <code>mcmc_pairs</code> , an integer representing the maximum tredepth allowed when fitting the model (if fit using NUTS). This is only needed for detecting which transitions (if any) hit the maximum tredepth.
grid_args, save_gg_objects	For <code>mcmc_pairs</code> , arguments to pass to <code>bayesplot_grid</code> . For example, since <code>mcmc_pairs</code> returns more than a single ggplot object, using <code>ggtitle</code> afterwards will not work. But you you can still add a title to the plot using <code>grid_args = list(top="My title")</code> .

`div_color`, `div_shape`, `div_size`, `div_alpha`, `td_color`, `td_shape`, `td_size`, `td_alpha`

Optional arguments to the `scatter_style_np` or `pairs_style_np` helper functions that are eventually passed to `geom_point`. The default values are displayed in the **Usage** section above.

`chains`, `draws`, `nuts`

Optional arguments to the `pairs_condition` helper function, which is used to specify the condition argument for `mcmc_pairs`.

- The `chains` argument can be used to select some subset of the chains. If `chains` is an integer vector then the behavior is the same as the default (half the chains above the diagonal and half below) except using only the specified subset of chains. Alternatively, `chains` can be a list of two integer vectors with the first specifying the chains to be shown in the plots above the diagonal and the second for below the diagonal.
- The `draws` argument to `pairs_condition` can be used to directly specify which realizations are plotted above and below the diagonal. `draws` can be a single proportion, which is interpreted as the proportion of realizations (among all chains) to plot in the lower panel starting with the first realization in each chain, with the complement (from the end of each chain) plotted in the upper panel. Alternatively `draws` can be a logical vector with length equal to the product of the number of iterations and the number of chains, in which case realizations corresponding to `FALSE` and `TRUE` will be plotted in the lower and upper panels, respectively.
- For models fit using NUTS, the `nuts` argument to `pairs_condition` can be used. It takes a (possibly abbreviated) string to select among `"accept_stat__"`, `"stepsize__"`, `"treedepth__"`, `"n_leapfrog__"`, `"divergent__"`, `"energy__"`, and `"lp__"`. These are the sampler parameters associated with NUTS (and `"lp__"` is the log-posterior up to an additive constant). In this case, plots below the diagonal will contain realizations that are below the median of the indicated variable (or are zero in the case of `"divergent__"`), and plots above the diagonal will contain realizations that are greater than or equal to the median of the indicated variable (or are one in the case of `"divergent__"`). If `"lp__"` is used then the `lp` argument to `mcmc_pairs` must also be specified. For the other NUTS parameters the `np` argument to `mcmc_pairs` must also be specified.

## Value

`mcmc_scatter` and `mcmc_hex` return a ggplot object that can be further customized using the **ggplot2** package.

`mcmc_pairs` returns many ggplot objects organized into a grid via `bayesplot_grid`.

## Plot Descriptions

`mcmc_scatter` Bivariate scatterplot of posterior draws. If using a very large number of posterior draws then `mcmc_hex` may be preferable to avoid overplotting. For models fit using NUTS the `np`, and `np_style` arguments can be used to add additional information in the plot (in this case the approximate location of divergences).

`mcmc_hex` Hexagonal heatmap of 2-D bin counts. This plot is useful in cases where the posterior sample size is large enough that `mcmc_scatter` suffers from overplotting.

`mcmc_pairs` A square plot matrix with univariate marginal distributions along the diagonal (as histograms or kernel density plots) and bivariate distributions off the diagonal (as scatterplots or hex heatmaps).

For the off-diagonal plots, the default is to split the chains so that (roughly) half are displayed above the diagonal and half are below (all chains are always merged together for the plots along the diagonal). Other possibilities are available by setting the `condition` argument.

Additionally, extra diagnostic information for models fit using [NUTS](#) can be added to the pairs plot using the `lp`, `np`, and `np_style` arguments. If `np` is specified (and `condition` is *not* "divergent\_\_"), then points (red, by default) will be superimposed onto the off-diagonal plots indicating which (if any) iterations encountered a divergent transition. Also, if both `np` and `max_treedepth` are specified then points (yellow, by default) will be superimposed to indicate a transition that hit the maximum treedepth rather than terminated its evolution normally. The `np_style` argument can be used with the `pairs_style_np` convenience function to change the appearance of these overlaid points. See the **Examples** section.

    np = np
  )

  # more customizations:
  # - transform sigma to log(sigma)
  # - median log-posterior as 'condition'
  # - hex instead of scatter for off-diagonal plots
  # - show points where max treedepth hit in blue
  color_scheme_set("darkgray")
  mcmc_pairs(
    posterior,
    pars = c("wt", "cyl", "sigma"),
    transform = list(sigma = "log"),
    off_diag_fun = "hex",
    condition = pairs_condition(nuts = "lp__"),
    lp = log_posterior(fit),
    np = np,
    np_style = pairs_style_np(div_color = "firebrick",
                              td_color = "blue",
                              td_size = 2),
    # for demonstration purposes, set max_treedepth to a value that will
    # result in at least a few max treedepth warnings
    max_treedepth = with(np, -1 + max(Value[Parameter == "treedepth__"]))
  )

  ## End(Not run)

```

## Description

Trace plot (or traceplot) of MCMC draws. See the **Plot Descriptions** section, below, for details.

## Usage

```
mcmc_trace(x, pars = character(), regex_pars = character(),
  transformations = list(), facet_args = list(), ..., n_warmup = 0,
  window = NULL, size = NULL, np = NULL, np_style = trace_style_np(),
  divergences = NULL)
```

```
mcmc_trace_highlight(x, pars = character(), regex_pars = character(),
  transformations = list(), facet_args = list(), ..., n_warmup = 0,
  window = NULL, size = NULL, alpha = 0.2, highlight = 1)
```

```
trace_style_np(div_color = "red", div_size = 0.25, div_alpha = 1)
```

## Arguments

x	A 3-D array, matrix, list of matrices, or data frame of MCMC draws. The <a href="#">MCMC-overview</a> page provides details on how to specify each these allowed inputs.
pars	An optional character vector of parameter names. If neither pars nor regex_pars is specified then the default is to use <i>all</i> parameters.
regex_pars	An optional <a href="#">regular expression</a> to use for parameter selection. Can be specified instead of pars or in addition to pars.
transformations	<p>Optionally, transformations to apply to parameters before plotting. If transformations is a function or a single string naming a function then that function will be used to transform all parameters. To apply transformations to particular parameters, the transformations argument can be a named list with length equal to the number of parameters to be transformed. Currently only univariate transformations of scalar parameters can be specified (multivariate transformations will be implemented in a future release). If transformations is a list, the name of each list element should be a parameter name and the content of each list element should be a function (or any item to match as a function via <a href="#">match.fun</a>, e.g. a string naming a function). If a function is specified by its name as a string (e.g. "log"), then it can be used to construct a new parameter label for the appropriate parameter (e.g. "log(sigma)"). If a function itself is specified (e.g. log or function(x) log(x)) then "t" is used in the new parameter label to indicate that the parameter is transformed (e.g. "t(sigma)").</p> <p>Note: due to partial argument matching transformations can be abbreviated for convenience in interactive use (e.g., transform, trans, etc.).</p>
facet_args	A named list of arguments (other than facets) passed to <a href="#">facet_wrap</a> or <a href="#">facet_grid</a> to control faceting.
...	Currently ignored.

n_warmup	An integer; the number of warmup iterations included in x. The default is n_warmup = 0, i.e. to assume no warmup iterations are included. If n_warmup > 0 then the background for iterations 1:n_warmup is shaded gray.
window	An integer vector of length two specifying the limits of a range of iterations to display.
size	An optional value to override the default line size (mcmc_trace) or the default point size (mcmc_trace_highlight).
np	For models fit using <a href="#">NUTS</a> (more generally, any <a href="#">symplectic integrator</a> ), an optional data frame providing NUTS diagnostic information. The data frame should be the object returned by <a href="#">nuts_params</a> or one with the same structure. If np is specified then tick marks are added to the bottom of the trace plot indicating within which iterations there was a divergence (if there were any). See the end of the <b>Examples</b> section, below.
np_style	A call to the trace_style_np helper function to specify arguments controlling the appearance of tick marks representing divergences (if the np argument is specified).
divergences	Deprecated. Use the np argument instead.
alpha	For mcmc_trace_highlight, passed to <a href="#">geom_point</a> to control the transparency of the points for the chains not highlighted.
highlight	For mcmc_trace_highlight, an integer specifying one of the chains that will be more visible than the others in the plot.
div_color, div_size, div_alpha	Optional arguments to the trace_style_np helper function that are eventually passed to <a href="#">geom_rug</a> if the np argument is also specified. They control the color, size, and transparency specifications for showing divergences in the plot. The default values are displayed in the <b>Usage</b> section above.

### Value

A ggplot object that can be further customized using the [ggplot2](#) package.

### Plot Descriptions

**mcmc\_trace** Standard trace plots of MCMC draws. For models fit using [NUTS](#), the np argument can be used to also show divergences on the trace plot.

**mcmc\_trace\_highlight** Traces are plotted using points rather than lines and the opacity of all chains but one (specified by the highlight argument) is reduced.

)

## End(Not run)

```

---

PPC-discrete

*PPCs for discrete outcomes*

---

## Description

Many of the [PPC](#) functions in **bayesplot** can be used with discrete data. The small subset of these functions that can *only* be used if `y` and `yrep` are discrete are documented on this page. Currently these include rootograms for count outcomes and bar plots for ordinal, categorical, and multinomial outcomes. See the **Plot Descriptions** section below.

## Usage

```

ppc_bars(y, yrep, ..., prob = 0.9, width = 0.9, size = 1, fatten = 3,
  freq = TRUE)

ppc_bars_grouped(y, yrep, group, facet_args = list(), ..., prob = 0.9,
  width = 0.9, size = 1, fatten = 3, freq = TRUE)

```

```
ppc_rootogram(y, yrep, style = c("standing", "hanging", "suspended"), ...,
  prob = 0.9, size = 1)
```

### Arguments

<code>y</code>	A vector of observations. See <b>Details</b> .
<code>yrep</code>	An $S$ by $N$ matrix of draws from the posterior predictive distribution, where $S$ is the size of the posterior sample (or subset of the posterior sample used to generate <code>yrep</code> ) and $N$ is the number of observations (the length of <code>y</code> ). The columns of <code>yrep</code> should be in the same order as the data points in <code>y</code> for the plots to make sense. See <b>Details</b> for additional instructions.
<code>...</code>	Currently unused.
<code>prob</code>	A value between 0 and 1 indicating the desired probability mass to include in the <code>yrep</code> intervals. Set <code>prob=0</code> to remove the intervals. For <code>ppc_rootogram</code> these are intervals of the <i>square roots</i> of the expected counts.
<code>width</code>	For <code>ppc_bars</code> and <code>ppc_bars_grouped</code> , passed to <a href="#">geom_bar</a> to control the bar width.
<code>size, fatten</code>	For <code>ppc_bars</code> and <code>ppc_bars_grouped</code> , <code>size</code> and <code>fatten</code> are passed to <a href="#">geom_pointrange</a> to control the appearance of the <code>yrep</code> points and intervals. For <code>ppc_rootogram</code> <code>size</code> is passed to <a href="#">geom_line</a> .
<code>freq</code>	For <code>ppc_bars</code> and <code>ppc_bars_grouped</code> , if TRUE (the default) the y-axis will display counts. Setting <code>freq=FALSE</code> will put proportions on the y-axis.
<code>group</code>	A grouping variable (a vector or factor) the same length as <code>y</code> . Each value in <code>group</code> is interpreted as the group level pertaining to the corresponding value of <code>y</code> .
<code>facet_args</code>	An optional list of arguments (other than facets) passed to <a href="#">facet_wrap</a> to control faceting.
<code>style</code>	For <code>ppc_rootogram</code> , a string specifying the rootogram style. The options are "standing", "hanging", and "suspended". See the <b>Plot Descriptions</b> section, below, for details on the different styles.

### Details

For all of these plots `y` and `yrep` must be non-negative integers, although they need not be integers in the strict sense of R's [integer](#) type.

### Value

A ggplot object that can be further customized using the **ggplot2** package.

### Plot Descriptions

`ppc_bars` Bar plot of `y` with `yrep` medians and uncertainty intervals superimposed on the bars.

`ppc_bars_grouped` Same as `ppc_bars` but a separate plot (facet) is generated for each level of a grouping variable.

`ppc_rootogram` Rootograms allow for diagnosing problems in count data models such as overdispersion or excess zeros. They consist of a histogram of  $y$  with the expected counts based on `yrep` overlaid as a line along with uncertainty intervals. The y-axis represents the square roots of the counts to approximately adjust for scale differences and thus ease comparison between observed and expected counts. Using the `style` argument, the histogram style can be adjusted to focus on different aspects of the data:

- *Standing*: basic histogram of observed counts with curve showing expected counts.
- *Hanging*: observed counts hanging from the curve representing expected counts.
- *Suspended*: histogram of the differences between expected and observed counts.

**All of these are plotted on the square root scale.** See Kleiber and Zeileis (2016) for advice on interpreting rootograms and selecting among the different styles.

---

PPC-distributions	<i>PPC distributions</i>
-------------------	--------------------------

---

## Description

Compare the empirical distribution of the data `y` to the distributions of simulated/replicated data `yrep` from the posterior predictive distribution. See the **Plot Descriptions** section, below, for details.

## Usage

```
ppc_data(y, yrep, group = NULL)

ppc_hist(y, yrep, ..., binwidth = NULL, breaks = NULL, freq = TRUE)

ppc_boxplot(y, yrep, ..., notch = TRUE, size = 0.5, alpha = 1)

ppc_freqpoly(y, yrep, ..., binwidth = NULL, freq = TRUE, size = 0.25,
  alpha = 1)

ppc_freqpoly_grouped(y, yrep, group, ..., binwidth = NULL, freq = TRUE,
  size = 0.25, alpha = 1)

ppc_dens(y, yrep, ..., trim = FALSE, size = 0.5, alpha = 1)

ppc_dens_overlay(y, yrep, ..., size = 0.25, alpha = 0.7, trim = FALSE,
  bw = "nrd0", adjust = 1, kernel = "gaussian", n_dens = 1024)

ppc_ecdf_overlay(y, yrep, ..., discrete = FALSE, pad = TRUE, size = 0.25,
  alpha = 0.7)

ppc_violin_grouped(y, yrep, group, ..., probs = c(0.1, 0.5, 0.9), size = 1,
  alpha = 1, y_draw = c("violin", "points", "both"), y_size = 1,
  y_alpha = 1, y_jitter = 0.1)
```

## Arguments

<code>y</code>	A vector of observations. See <b>Details</b> .
<code>yrep</code>	An $S$ by $N$ matrix of draws from the posterior predictive distribution, where $S$ is the size of the posterior sample (or subset of the posterior sample used to generate <code>yrep</code> ) and $N$ is the number of observations (the length of <code>y</code> ). The columns of <code>yrep</code> should be in the same order as the data points in <code>y</code> for the plots to make sense. See <b>Details</b> for additional instructions.

group	A grouping variable (a vector or factor) the same length as y. Each value in group is interpreted as the group level pertaining to the corresponding value of y.
...	Currently unused.
binwidth	Passed to <a href="#">geom_histogram</a> to override the default binwidth.
breaks	Passed to <a href="#">geom_histogram</a> as an alternative to binwidth.
freq	For histograms, freq=TRUE (the default) puts count on the y-axis. Setting freq=FALSE puts density on the y-axis. (For many plots the y-axis text is off by default. To view the count or density labels on the y-axis see the <a href="#">yaxis_text</a> convenience function.)
notch	A logical scalar passed to <a href="#">geom_boxplot</a> . Unlike for <a href="#">geom_boxplot</a> , the default is notch=TRUE.
size, alpha	Passed to the appropriate geom to control the appearance of the yrep distributions.
trim	A logical scalar passed to <a href="#">geom_density</a> .
bw, adjust, kernel, n_dens	Optional arguments passed to <a href="#">density</a> to override default kernel density estimation parameters. n_dens defaults to 1024.
discrete	For <a href="#">ppc_ecdf_overlay</a> , should the data be treated as discrete? The default is FALSE, in which case geom="line" is passed to <a href="#">stat_ecdf</a> . If discrete is set to TRUE then geom="step" is used.
pad	A logical scalar passed to <a href="#">stat_ecdf</a> .
probs	A numeric vector passed to <a href="#">geom_violin</a> 's draw_quantiles argument to specify at which quantiles to draw horizontal lines. Set to NULL to remove the lines.
y_draw	For <a href="#">ppc_violin_grouped</a> , a string specifying how to draw y: "violin" (default), "points" (jittered points), or "both".
y_jitter, y_size, y_alpha	For <a href="#">ppc_violin_grouped</a> , if y_draw is "points" or "both" then y_size, y_alpha, and y_jitter are passed to to the size, alpha, and width arguments of <a href="#">geom_jitter</a> to control the appearance of y points. The default of y_jitter=NULL will let <b>ggplot2</b> determine the amount of jitter.

## Details

For Binomial data, the plots will typically be most useful if y and yrep contain the "success" proportions (not discrete "success" or "failure" counts).

## Value

A ggplot object that can be further customized using the **ggplot2** package. The `_data` functions return the data that would have been drawn by the plotting function.

## Plot Descriptions

`ppc_hist`, `ppc_freqpoly`, `ppc_dens`, `ppc_boxplot` A separate histogram, shaded frequency polygon, smoothed kernel density estimate, or box and whiskers plot is displayed for `y` and each dataset (row) in `yrep`. For these plots `yrep` should therefore contain only a small number of rows. See the **Examples** section.

`ppc_freqpoly_grouped` A separate frequency polygon is plotted for each level of a grouping variable for `y` and each dataset (row) in `yrep`. For this plot `yrep` should therefore contain only a small number of rows. See the **Examples** section.

`ppc_dens_overlay`, `ppc_ecdf_overlay` Kernel density or empirical CDF estimates of each dataset (row) in `yrep` are overlaid, with the distribution of `y` itself on top (and in a darker shade). When using `ppc_ecdf_overlay` with discrete data set the `discrete` argument to `TRUE` for better results.

`ppc_violin_grouped` The density estimate of `yrep` within each level of a grouping variable is plotted as a violin with horizontal lines at notable quantiles. `y` is overlaid on the plot either as a violin, points, or both, depending on the `y_draw` argument.

ppc_violin_grouped(y, yrep, group, alpha = 0)

# change how y is drawn
ppc_violin_grouped(y, yrep, group, alpha = 0, y_draw = "points", y_size = 1.5)
ppc_violin_grouped(y, yrep, group, alpha = 0, y_draw = "both",
  y_size = 1.5, y_alpha = 0.5, y_jitter = 0.33)

```

---

PPC-errors

*PPC errors*

---

## Description

Various plots of predictive errors  $y - \text{yrep}$ . See the **Details** and **Plot Descriptions** sections, below.

## Usage

```

ppc_error_hist(y, yrep, ..., binwidth = NULL, breaks = NULL, freq = TRUE)

ppc_error_hist_grouped(y, yrep, group, ..., binwidth = NULL, breaks = NULL,
  freq = TRUE)

ppc_error_scatter(y, yrep, ..., size = 2.5, alpha = 0.8)

ppc_error_scatter_avg(y, yrep, ..., size = 2.5, alpha = 0.8)

ppc_error_scatter_avg_vs_x(y, yrep, x, ..., size = 2.5, alpha = 0.8)

ppc_error_binned(y, yrep, ..., size = 1, alpha = 0.25)

```

## Arguments

**y** A vector of observations. See **Details**.

yrep	An $S$ by $N$ matrix of draws from the posterior predictive distribution, where $S$ is the size of the posterior sample (or subset of the posterior sample used to generate yrep) and $N$ is the number of observations (the length of y). The columns of yrep should be in the same order as the data points in y for the plots to make sense. See <b>Details</b> for additional instructions.
...	Currently unused.
binwidth	Passed to <a href="#">geom_histogram</a> to override the default binwidth.
breaks	Passed to <a href="#">geom_histogram</a> as an alternative to binwidth.
freq	For histograms, freq=TRUE (the default) puts count on the y-axis. Setting freq=FALSE puts density on the y-axis. (For many plots the y-axis text is off by default. To view the count or density labels on the y-axis see the <a href="#">yaxis_text</a> convenience function.)
group	A grouping variable (a vector or factor) the same length as y. Each value in group is interpreted as the group level pertaining to the corresponding value of y.
size, alpha	For scatterplots, arguments passed to <a href="#">geom_point</a> to control the appearance of the points. For the binned error plot, arguments controlling the size of the outline and opacity of the shaded region indicating the 2-SE bounds.
x	A numeric vector the same length as y to use as the x-axis variable.

### Details

All of these functions (aside from the \*\_scatter\_avg functions) compute and plot predictive errors for each row of the matrix yrep, so it is usually a good idea for yrep to contain only a small number of draws (rows). See **Examples**, below.

For binomial and Bernoulli data the ppc\_error\_binned function can be used to generate binned error plots. Bernoulli data can be input as a vector of 0s and 1s, whereas for binomial data y and yrep should contain "success" proportions (not counts). See the **Examples** section, below.

### Value

A ggplot object that can be further customized using the **ggplot2** package.

### Plot descriptions

- ppc\_error\_hist A separate histogram is plotted for the predictive errors computed from y and each dataset (row) in yrep. For this plot yrep should have only a small number of rows.
- ppc\_error\_hist\_grouped Like ppc\_error\_hist, except errors are computed within levels of a grouping variable. The number of histograms is therefore equal to the product of the number of rows in yrep and the number of groups (unique values of group).
- ppc\_error\_scatter A separate scatterplot is displayed for y vs. the predictive errors computed from y and each dataset (row) in yrep. For this plot yrep should have only a small number of rows.
- ppc\_error\_scatter\_avg A single scatterplot of y vs. the average of the errors computed from y and each dataset (row) in yrep. For each individual data point y[n] the average error is the average of the errors for y[n] computed over the the draws from the posterior predictive distribution.

`ppc_error_scatter_avg_vs_x` Same as `ppc_error_scatter_avg`, except the average is plotted on the  $y$ -axis and a predictor variable  $x$  is plotted on the  $x$ -axis.

`ppc_error_binned` Intended for use with binomial data. A separate binned error plot (similar to [binnedplot](#)) is generated for each dataset (row) in `yrep`. For this plot `y` and `yrep` should contain proportions rather than counts, and `yrep` should have only a small number of rows.

formula(example_model)

# get observed proportion of "successes"
y <- example_model$y # matrix of "success" and "failure" counts
trials <- rowSums(y)
y_prop <- y[, 1] / trials # proportions

# get predicted success proportions
yrep <- posterior_predict(example_model)
```

```

yrep_prop <- sweep(yrep, 2, trials, "/")

ppc_error_binned(y_prop, yrep_prop[1:6, ])

## End(Not run)

```

---

PPC-intervals

*PPC intervals*

---

## Description

Medians and central interval estimates of yrep with y overlaid. See the **Plot Descriptions** section, below.

## Usage

```

ppc_intervals(y, yrep, x = NULL, ..., prob = 0.5, prob_outer = 0.9,
  size = 1, fatten = 3)

ppc_intervals_grouped(y, yrep, x = NULL, group, facet_args = list(), ...,
  prob = 0.5, prob_outer = 0.9, size = 1, fatten = 3)

ppc_ribbon(y, yrep, x = NULL, ..., prob = 0.5, prob_outer = 0.9,
  alpha = 0.33, size = 0.25)

ppc_ribbon_grouped(y, yrep, x = NULL, group, facet_args = list(), ...,
  prob = 0.5, prob_outer = 0.9, alpha = 0.33, size = 0.25)

ppc_intervals_data(y, yrep, x = NULL, group = NULL, prob = 0.5,
  prob_outer = 0.9, ...)

ppc_ribbon_data(y, yrep, x = NULL, group = NULL, prob = 0.5,
  prob_outer = 0.9, ...)

```

## Arguments

y	A vector of observations. See <b>Details</b> .
yrep	An $S$ by $N$ matrix of draws from the posterior predictive distribution, where $S$ is the size of the posterior sample (or subset of the posterior sample used to generate yrep) and $N$ is the number of observations (the length of y). The columns of yrep should be in the same order as the data points in y for the plots to make sense. See <b>Details</b> for additional instructions.
x	A numeric vector the same length as y to use as the x-axis variable. For example, x could be a predictor variable from a regression model, a time variable for time-series models, etc. If x is missing or NULL, then $1:\text{length}(y)$ is used for the x-axis.

... Currently unused.

`prob, prob_outer` Values between 0 and 1 indicating the desired probability mass to include in the inner and outer intervals. The defaults are `prob=0.5` and `prob_outer=0.9`.

`group` A grouping variable (a vector or factor) the same length as `y`. Each value in `group` is interpreted as the group level pertaining to the corresponding value of `y`.

`facet_args` An optional list of arguments (other than facets) passed to [facet\\_wrap](#) to control faceting.

`alpha, size, fatten` Arguments passed to geoms. For ribbon plots `alpha` and `size` are passed to [geom\\_ribbon](#). For interval plots `size` and `fatten` are passed to [geom\\_pointrange](#).

## Value

A `ggplot` object that can be further customized using the **ggplot2** package. The `_data` functions return the data that would have been drawn by the plotting function.

## Plot Descriptions

`ppc_intervals`, `ppc_ribbon` `100*prob%` central intervals for `yrep` at each `x` value. `ppc_intervals` plots intervals as vertical bars with points indicating `yrep` medians and darker points indicating observed `y` values. `ppc_ribbon` plots a ribbon of connected intervals with a line through the median of `yrep` and a darker line connecting observed `y` values. In both cases an optional `x` variable can also be specified for the x-axis variable.

Depending on the number of observations and the variability in the predictions at different values of `x`, one or the other of these plots may be easier to read than the other.

`ppc_intervals_grouped`, `ppc_ribbon_grouped` Same as `ppc_intervals` and `ppc_ribbon`, respectively, but a separate plot (facet) is generated for each level of a grouping variable.

  ..., prob = 0.5, prob_outer = 0.9, size = 1, fatten = 3,
  order = c("index", "median"))

ppc_loo_ribbon(y, yrep, lw, psis_object, subset = NULL, intervals = NULL,
  ..., prob = 0.5, prob_outer = 0.9, alpha = 0.33, size = 0.25)
```

## Arguments

<code>y</code>	A vector of observations. See <b>Details</b> .
<code>yrep</code>	An $S$ by $N$ matrix of draws from the posterior predictive distribution, where $S$ is the size of the posterior sample (or subset of the posterior sample used to generate <code>yrep</code> ) and $N$ is the number of observations (the length of <code>y</code> ). The columns of <code>yrep</code> should be in the same order as the data points in <code>y</code> for the plots to make sense. See <b>Details</b> for additional instructions.
<code>lw</code>	A matrix of (smoothed) log weights with the same dimensions as <code>yrep</code> . See <a href="#">psis</a> and the associated <code>weights</code> method and the <b>Examples</b> section, below.
<code>pit</code>	For <code>ppc_loo_pit_overlay</code> and <code>ppc_loo_pit_qq</code> , optionally a vector of pre-computed PIT values that can be specified instead of <code>y</code> , <code>yrep</code> , and <code>lw</code> (these are all ignored if <code>pit</code> is specified). If not specified the PIT values are computed internally before plotting.
<code>samples</code>	For <code>ppc_loo_pit_overlay</code> , the number of data sets (each the same size as <code>y</code> ) to simulate from the standard uniform distribution. The default is 100. The density estimate of each dataset is plotted as a thin line in the plot, with the density estimate of the LOO PITs overlaid as a thicker dark line.
<code>...</code>	Currently unused.

alpha, size, fatten	Arguments passed to code geoms to control plot aesthetics. For <code>ppc_loo_pit_qq</code> and <code>ppc_loo_pit_overlay</code> , size and alpha are passed to <code>geom_point</code> and <code>geom_density</code> , respectively. For <code>ppc_loo_intervals</code> , size and fatten are passed to <code>geom_pointrange</code> . For <code>ppc_loo_ribbon</code> , alpha and size are passed to <code>geom_ribbon</code> .
trim	Passed to <code>stat_density</code> .
bw, adjust, kernel, n_dens	Optional arguments passed to <code>density</code> to override default kernel density estimation parameters. <code>n_dens</code> defaults to 1024.
compare	For <code>ppc_loo_pit_qq</code> , a string that can be either "uniform" or "normal". If "uniform" (the default) the Q-Q plot compares computed PIT values to the standard uniform distribution. If <code>compare="normal"</code> , the Q-Q plot compares standardized PIT values to the standard normal distribution.
psis_object	If using <b>loo</b> version 2.0.0 or greater, an object returned by the <code>psis</code> function (or by the <code>loo</code> function with argument <code>save_psis</code> set to TRUE).
subset	For <code>ppc_loo_intervals</code> and <code>ppc_loo_ribbon</code> , an optional integer vector indicating which observations in <code>y</code> (and <code>yrep</code> ) to include. Dropping observations from <code>y</code> and <code>yrep</code> manually before passing them to the plotting function will not work because the dimensions will not match up with the dimensions of <code>psis_object</code> , but if all of <code>y</code> and <code>yrep</code> are passed along with <code>subset</code> then <b>bayesplot</b> can do the subsetting internally for <code>y</code> , <code>yrep</code> and <code>psis_object</code> . See the <b>Examples</b> section for a demonstration.
intervals	For <code>ppc_loo_intervals</code> and <code>ppc_loo_ribbon</code> , optionally a matrix of precomputed LOO predictive intervals that can be specified instead of <code>yrep</code> and <code>lw</code> (these are both ignored if <code>intervals</code> is specified). If not specified the intervals are computed internally before plotting. If specified, <code>intervals</code> must be a matrix with number of rows equal to the number of data points and five columns in the following order: lower outer interval, lower inner interval, median (50%), upper inner interval and upper outer interval (column names are ignored).
prob, prob_outer	Values between 0 and 1 indicating the desired probability mass to include in the inner and outer intervals. The defaults are <code>prob=0.5</code> and <code>prob_outer=0.9</code> .
order	For <code>ppc_loo_intervals</code> , a string indicating how to arrange the plotted intervals. The default ("index") is to plot them in the order of the observations. The alternative ("median") arranges them by median value from smallest (left) to largest (right).

## Value

A ggplot object that can be further customized using the **ggplot2** package.

## Plot Descriptions

`ppc_loo_pit_qq`, `ppc_loo_pit_overlay` The calibration of marginal predictions can be assessed using probability integral transformation (PIT) checks. LOO improves the check by avoiding the double use of data. See the section on marginal predictive checks in Gelman et al. (2013,

p. 152–153) and section 5 of Gabry et al. (2018) for an example of using **bayesplot** for these checks.

The LOO PIT values are asymptotically uniform (for continuous data) if the model is calibrated. The `ppc_loo_pit_overlay` function creates a plot comparing the density of the LOO PITs (thick line) to the density estimates of many simulated data sets from the standard uniform distribution (thin lines). See Gabry et al. (2018) for an example of interpreting the shape of the miscalibration that can be observed in these plots.

The `ppc_loo_pit_qq` function provides an alternative visualization of the miscalibration with a quantile-quantile (Q-Q) plot comparing the LOO PITs to the standard uniform distribution. Comparing to the uniform is not good for extreme probabilities close to 0 and 1, so it can sometimes be useful to set the `compare` argument to "normal", which will produce a Q-Q plot comparing standardized PIT values to the standard normal distribution that can help see the (mis)calibration better for the extreme values. However, in most cases we have found that the overlaid density plot (`ppc_loo_pit_overlay`) function will provide a clearer picture of calibration problems than the Q-Q plot.

`ppc_loo_intervals`, `ppc_loo_ribbon` Similar to `ppc_intervals` and `ppc_ribbon` but the intervals are for the LOO predictive distribution.

## Description

The **bayesplot** PPC module provides various plotting functions for creating graphical displays comparing observed data to simulated data from the posterior predictive distribution. See below for a brief discussion of the ideas behind posterior predictive checking, a description of the structure of this package, and tips on providing an interface to **bayesplot** from another package.

## Details

The idea behind posterior predictive checking is simple: if a model is a good fit then we should be able to use it to generate data that looks a lot like the data we observed.

**Posterior predictive distribution:** To generate the data used for posterior predictive checks we simulate from the *posterior predictive distribution*. The posterior predictive distribution is the distribution of the outcome variable implied by a model after using the observed data  $y$  (a vector of outcome values), and typically predictors  $X$ , to update our beliefs about the unknown parameters  $\theta$  in the model. For each draw of the parameters  $\theta$  from the posterior distribution  $p(\theta | y, X)$  we generate an entire vector of outcomes. The result is an  $S \times N$  matrix of simulations, where  $S$  is the size of the posterior sample (number of draws from the posterior distribution) and  $N$  is the number of data points in  $y$ . That is, each row of the matrix is an individual "replicated" dataset of  $N$  observations.

**Notation:** When simulating from the posterior predictive distribution we can use either the same values of the predictors  $X$  that we used when fitting the model or new observations of those predictors. When we use the same values of  $X$  we denote the resulting simulations by  $y^{rep}$  as they can be thought of as *replications* of the outcome  $y$  rather than predictions for future observations. This corresponds to the notation from Gelman et. al. (2013) and is the notation used throughout the documentation for this package.

**Graphical posterior predictive checking:** Using the datasets  $y^{rep}$  drawn from the posterior predictive distribution, the functions in the **bayesplot** package produce various graphical displays comparing the observed data  $y$  to the replications. For a more thorough discussion of posterior predictive checking see Chapter 6 of Gelman et. al. (2013).

## PPC plotting functions

The plotting functions for posterior predictive checking in this package are organized into several categories, each with its own documentation:

**Distributions** Histograms, kernel density estimates, boxplots, and other plots comparing the empirical distribution of the observed data  $y$  to the distributions of individual replicated datasets (rows) in `yrep`.

**Test statistics** The distribution of a test statistic, or a pair of test statistics, over the replicated datasets (rows) in `yrep` compared to value of the statistic(s) computed from  $y$ .

**Intervals** Interval estimates of `yrep` with  $y$  overlaid. The x-axis variable can be optionally specified by the user (e.g. to plot against a predictor variable or over time).

**Predictive errors** Plots of predictive errors ( $y - yrep$ ) computed from  $y$  and replicated datasets (rows) in `yrep`. For binomial models binned error plots are also available.

**Scatterplots** Scatterplots (and similar visualizations) of the observed data  $y$  vs. individual replicated datasets (rows) in `yrep`, or vs. the average value of the distributions of each data point (columns) in `yrep`.

**Plots for discrete outcomes** PPC functions that can only be used if  $y$  and `yrep` are discrete. For example, rootograms for count outcomes and bar plots for ordinal, categorical, and multinomial outcomes.

**LOO predictive checks** PPC functions for predictive checks based on (approximate) leave-one-out (LOO) cross-validation.

## Providing an interface for posterior predictive checking from another package

In addition to the various plotting functions, the **bayesplot** package provides the S3 generic `pp_check`. Authors of R packages for Bayesian inference are encouraged to define `pp_check` methods for the fitted model objects created by their packages. See the package vignettes for more details and a simple example, and see the **rstanarm** and **brms** packages for full examples of `pp_check` methods.

---

 PPC-scatterplots

*PPC scatterplots*

---

**Description**

Scatterplots of the observed data  $y$  vs. simulated/replicated data  $y_{\text{rep}}$  from the posterior predictive distribution. See the **Plot Descriptions** and **Details** sections, below.

**Usage**

```
ppc_scatter(y, yrep, ..., size = 2.5, alpha = 0.8)
```

```
ppc_scatter_avg(y, yrep, ..., size = 2.5, alpha = 0.8)
```

```
ppc_scatter_avg_grouped(y, yrep, group, ..., size = 2.5, alpha = 0.8)
```

**Arguments**

<code>y</code>	A vector of observations. See <b>Details</b> .
<code>yrep</code>	An $S$ by $N$ matrix of draws from the posterior predictive distribution, where $S$ is the size of the posterior sample (or subset of the posterior sample used to generate <code>yrep</code> ) and $N$ is the number of observations (the length of <code>y</code> ). The columns of <code>yrep</code> should be in the same order as the data points in <code>y</code> for the plots to make sense. See <b>Details</b> for additional instructions.
<code>...</code>	Currently unused.
<code>size, alpha</code>	Arguments passed to <a href="#">geom_point</a> to control the appearance of the points.
<code>group</code>	A grouping variable (a vector or factor) the same length as <code>y</code> . Each value in <code>group</code> is interpreted as the group level pertaining to the corresponding value of <code>y</code> .

**Details**

For Binomial data, the plots will typically be most useful if `y` and `yrep` contain the "success" proportions (not discrete "success" or "failure" counts).

**Value**

A ggplot object that can be further customized using the **ggplot2** package.

### Plot Descriptions

`ppc_scatter` For each dataset (row) in `yrep` a scatterplot is generated showing `y` against that row of `yrep`. For this plot `yrep` should only contain a small number of rows.

`ppc_scatter_avg` A scatterplot of `y` against the average values of `yrep`, i.e., the points  $(\text{mean}(\text{yrep}[,n]), y[n])$ , where each `yrep[,n]` is a vector of length equal to the number of posterior draws.

`ppc_scatter_avg_grouped` The same as `ppc_scatter_avg`, but a separate plot is generated for each level of a grouping variable.

### Examples

```
y <- example_y_data()
yrep <- example_yrep_draws()
p1 <- ppc_scatter_avg(y, yrep)
p1
p2 <- ppc_scatter(y, yrep[20:23, ], alpha = 0.5, size = 1.5)
p2

# give x and y axes the same limits
lims <- ggplot2::lims(x = c(0, 160), y = c(0, 160))
p1 + lims
p2 + lims

group <- example_group_data()
ppc_scatter_avg_grouped(y, yrep, group, alpha = 0.7) + lims
```

---

PPC-test-statistics      *PPC test statistics*

---

### Description

The distribution of a test statistic  $T(\text{yrep})$ , or a pair of test statistics, over the simulated datasets in `yrep`, compared to the observed value  $T(y)$  computed from the data `y`. See the **Plot Descriptions** and **Details** sections, below.

**Usage**

```
ppc_stat(y, yrep, stat = "mean", ..., binwidth = NULL, breaks = NULL,
        freq = TRUE)

ppc_stat_grouped(y, yrep, group, stat = "mean", ..., facet_args = list(),
                binwidth = NULL, breaks = NULL, freq = TRUE)

ppc_stat_freqpoly_grouped(y, yrep, group, stat = "mean", ...,
                        facet_args = list(), binwidth = NULL, freq = TRUE)

ppc_stat_2d(y, yrep, stat = c("mean", "sd"), ..., size = 2.5, alpha = 0.7)
```

**Arguments**

y	A vector of observations. See <b>Details</b> .
yrep	An $S$ by $N$ matrix of draws from the posterior predictive distribution, where $S$ is the size of the posterior sample (or subset of the posterior sample used to generate yrep) and $N$ is the number of observations (the length of y). The columns of yrep should be in the same order as the data points in y for the plots to make sense. See <b>Details</b> for additional instructions.
stat	A single function or a string naming a function, except for ppc_stat_2d which requires a vector of exactly two functions or function names. In all cases the function(s) should take a vector input and return a scalar test statistic. If specified as a string (or strings) then the legend will display function names. If specified as a function (or functions) then generic naming is used in the legend.
...	Currently unused.
binwidth	Passed to <a href="#">geom_histogram</a> to override the default binwidth.
breaks	Passed to <a href="#">geom_histogram</a> as an alternative to binwidth.
freq	For histograms, freq=TRUE (the default) puts count on the y-axis. Setting freq=FALSE puts density on the y-axis. (For many plots the y-axis text is off by default. To view the count or density labels on the y-axis see the <a href="#">yaxis_text</a> convenience function.)
group	A grouping variable (a vector or factor) the same length as y. Each value in group is interpreted as the group level pertaining to the corresponding value of y.
facet_args	A named list of arguments (other than facets) passed to <a href="#">facet_wrap</a> or <a href="#">facet_grid</a> to control faceting.
size, alpha	Arguments passed to <a href="#">geom_point</a> to control the appearance of scatterplot points.

**Details**

For Binomial data, the plots will typically be most useful if y and yrep contain the "success" proportions (not discrete "success" or "failure" counts).

**Value**

A ggplot object that can be further customized using the **ggplot2** package.

## Plot Descriptions

`ppc_stat` A histogram of the distribution of a test statistic computed by applying `stat` to each dataset (row) in `yrep`. The value of the statistic in the observed data, `stat(y)`, is overlaid as a vertical line.

`ppc_stat_grouped`, `ppc_stat_freqpoly_grouped` The same as `ppc_stat`, but a separate plot is generated for each level of a grouping variable. In the case of `ppc_stat_freqpoly_grouped` the plots are frequency polygons rather than histograms.

`ppc_stat_2d` A scatterplot showing the joint distribution of two test statistics computed over the datasets (rows) in `yrep`. The value of the statistics in the observed data is overlaid as large point.

Gelman, A., Carlin, J. B., Stern, H. S., Dunson, D. B., Vehtari, A., and Rubin, D. B. (2013). *Bayesian Data Analysis*. Chapman & Hall/CRC Press, London, third edition. (Ch. 6)

## See Also

Other PPCs: [PPC-discrete](#), [PPC-distributions](#), [PPC-errors](#), [PPC-intervals](#), [PPC-loo](#), [PPC-overview](#), [PPC-scatterplots](#)

## Examples

```
y <- example_y_data()
yrep <- example_yrep_draws()
ppc_stat(y, yrep)
ppc_stat(y, yrep, stat = "sd") + legend_none()
ppc_stat_2d(y, yrep)
ppc_stat_2d(y, yrep, stat = c("median", "mean")) + legend_move("bottom")

color_scheme_set("teal")
group <- example_group_data()
ppc_stat_grouped(y, yrep, group)

color_scheme_set("mix-red-blue")
ppc_stat_freqpoly_grouped(y, yrep, group, facet_args = list(nrow = 2))

# use your own function to compute test statistics
color_scheme_set("brightblue")
q25 <- function(y) quantile(y, 0.25)
ppc_stat(y, yrep, stat = "q25") # legend includes function name

# can define the function in the 'stat' argument but then
# the legend doesn't include a function name
ppc_stat(y, yrep, stat = function(y) quantile(y, 0.25))
```

pp\_check

*Posterior predictive checks (S3 generic and default method)*

## Description

S3 generic with simple default method. The intent is to provide a generic so authors of other R packages who wish to provide interfaces to the functions in **bayesplot** will be encouraged to include `pp_check` methods in their package, preserving the same naming conventions for posterior predictive checking across many R packages for Bayesian inference. This is for the convenience of both users and developers. See the **Details** and **Examples** sections, below, and the package vignettes for examples of defining `pp_check` methods.

## Usage

```
pp_check(object, ...)

## Default S3 method:
pp_check(object, yrep, fun, ...)
```

## Arguments

<code>object</code>	Typically a fitted model object. The default method, however, takes <code>object</code> to be a <code>y</code> (outcome) vector.
<code>...</code>	For the generic, arguments passed to individual methods. For the default method, these are additional arguments to pass to <code>fun</code> .
<code>yrep</code>	For the default method, a <code>yrep</code> matrix passed to <code>fun</code> .
<code>fun</code>	For the default method, the plotting function to call. Can be any of the <a href="#">PPC functions</a> . The "ppc_" prefix can optionally be dropped if <code>fun</code> is specified as a string.

## Details

A package that creates fitted model objects of class "foo" can include a method `pp_check.foo` that prepares the appropriate inputs (`y`, `yrep`, etc.) for the **bayesplot** functions. The `pp_check.foo` method may, for example, let the user choose between various plots, calling the functions from **bayesplot** internally as needed. See **Examples**, below, and the package vignettes.

## Value

The exact form of the value returned by `pp_check` may vary by the class of `object`, but for consistency we encourage authors of methods to return the `ggplot` object created by one of **bayesplot**'s plotting functions. The default method returns the object returned by `fun`.

## Examples

```
# default method
y <- example_y_data()
yrep <- example_yrep_draws()
pp_check(y, yrep[1:50,], ppc_dens_overlay)

g <- example_group_data()
pp_check(y, yrep, fun = "stat_grouped", group = g, stat = "median")

# defining a method
x <- list(y = rnorm(50), yrep = matrix(rnorm(5000), nrow = 100, ncol = 50))
class(x) <- "foo"
pp_check.foo <- function(object, ..., type = c("multiple", "overlaid")) {
  y <- object[["y"]]
  yrep <- object[["yrep"]]
  switch(match.arg(type),
    multiple = ppc_hist(y, yrep[1:min(8, nrow(yrep))], drop = FALSE),
    overlaid = ppc_dens_overlay(y, yrep))
}
pp_check(x)
pp_check(x, type = "overlaid")
```

---

theme\_default

*Default bayesplot plotting theme*

---

## Description

The `theme_default` function returns the default ggplot [theme](#) used by the **bayesplot** plotting functions. See [bayesplot\\_theme\\_set](#) for details on setting and updating the plotting theme.

## Usage

```
theme_default(base_size = getOption("bayesplot.base_size", 12),
  base_family = getOption("bayesplot.base_family", "serif"))
```

## Arguments

`base_size`, `base_family`

Base font size and family (passed to [theme\\_bw](#)). It is possible to set `"bayesplot.base_size"` and `"bayesplot.base_family"` via [options](#) to change the defaults, which are 12 and "serif", respectively.

## Value

A ggplot [theme](#) object.

**See Also**

[bayesplot-helpers](#) for a variety of convenience functions, many of which provide shortcuts for tweaking theme elements after creating a plot.

[bayesplot-colors](#) to set or view the color scheme used for plotting.

**Examples**

```
class(theme_default())

bayesplot_theme_set() # defaults to setting theme_default()
x <- example_mcmc_draws()
mcmc_hist(x)

# change the default font size and family for bayesplots
bayesplot_theme_set(theme_default(base_size = 8, base_family = "sans"))
mcmc_hist(x)
mcmc_areas(x, regex_pars = "beta")

# change back
bayesplot_theme_set()
mcmc_areas(x, regex_pars = "beta")
```
